paediatricians***

# What is Fetal Alcohol Spectrum Disorder (FASD)

## *Why is it important?*

**Tip of the iceberg:** neurodevelopmental & physical effects of prenatal alcohol exposure

**Acquired brain injury:** severe neurodevelopment impairment +/- Physical features: facial, growth deficits, birth anomalies (biomarkers)

*Preventable, common cause of neurodevelopmental disability*

# FASD epidemiology in Australia

## Previous national surveillance

FAS/PFAS (2001-04) *Elliott et al*

92 cases, incidence rates considered underestimate

## Prevalence studies

Lililwan: high risk community in WA - *Fitzpatrick et al* - FASD 20%

Youth in detention in WA (Banksia Hill Project) - *Bower et al* - FASD 36%

*Important studies, yet not representative of national population*

# What this study adds

## *Australian context*

The **first national** study to identify children across the **entire FASD spectrum** using updated criteria (2016)\*

Includes FASD without physical features

Precursor to national registry (FASDAR)

## *International context*

*The only national FASD surveillance study*

*Comparison to Canadian FASD registry possible*

\* Bower C, Elliott EJ 2016, on behalf of the Steering Group. Report to the Australian Government Department of Health: "Australian Guide to the diagnosis of Fetal Alcohol Spectrum Disorder (FASD)"

# What data have we captured?

## Diagnostic patterns

- Clinical patterns
- Who / where are children diagnosed?

## Demographics

## Changes over time

# Methods: Case finding

## ***What?***

- Active surveillance
- Prospective national case-finding

## ***Who?***

- Children/adolescents < 15 years old
- Reporters: ~1500 paediatricians
  - %90 paed. in Australia
  - Monthly response rate 80-90%

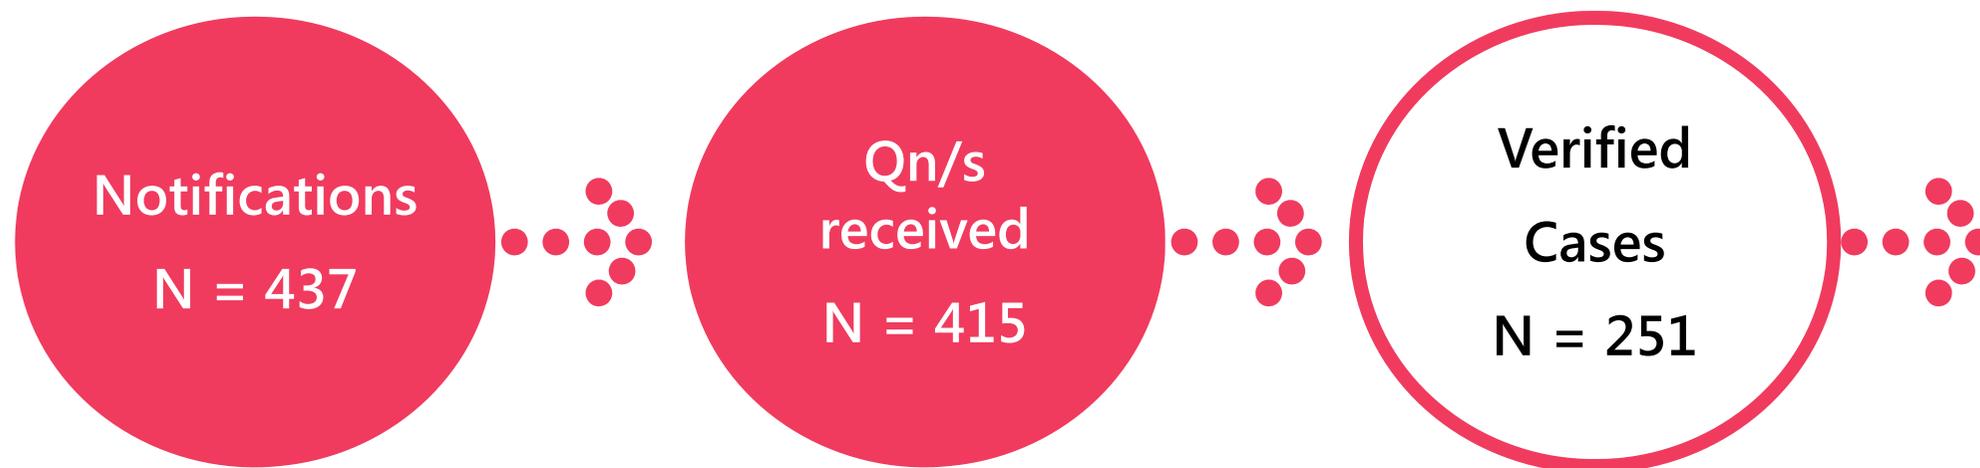

## ***When?***

- December 2014 – Dec 2017

## ***How?***

- Paediatrician reporting case completes questionnaire

# Verified cases: Dec 2014-Dec 2017

Age > 15y/diagnosis date n = 96  
Criteria not met n = 10  
Not yet classified n = 21

**FASD**

features

Methods:  
Diagnostic  
criteria

# FASD Classification (n=251)

---

**FASD  
+3SFF**      **24 %**

Median age      7.6y\*

---

Female:male      1 : 1.6\*\*

---

**FASD  
<3SFF**      **76 %**

Median age      9.2y

---

Female:male      1 : 1.9

---

\* Significant difference ( $p < 0.001$ )

\*\* No significant difference ( $p = 0.59$ )

# Prenatal alcohol exposure

19% used standardised tool (typically AUDIT-C)

## High risk exposure

**40%** 7+ std drinks *per week*

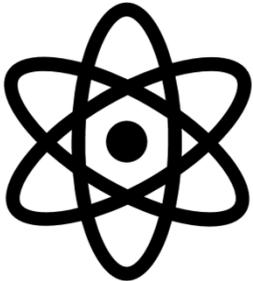

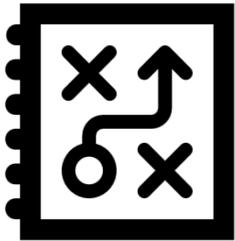

**32%** 5+ std drinks *on a single occasion*

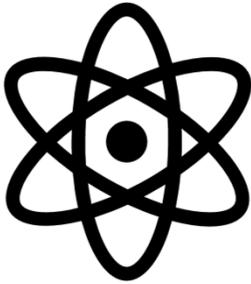

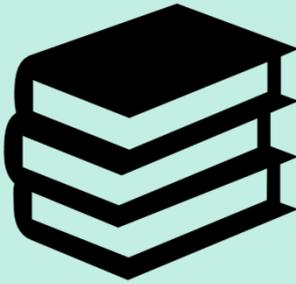

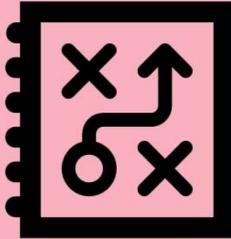

Risk level not reported in ~60% of cases

41% birth mothers reported to have alcohol use disorder

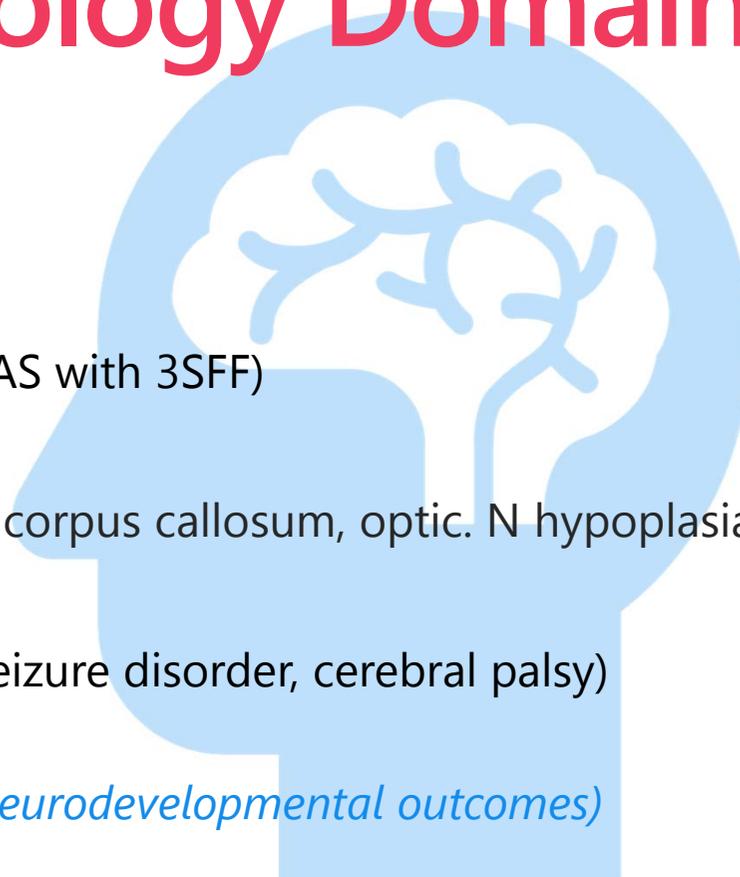

18% alcohol related health problems/injury

				
Brain structure /neurology	Motor skills	Cognition	Language	Academic Achievement
<i>Neurodevelopmental Domains</i>				
				
Memory	Attention	Executive function, Impulse control Hyperactivity	Affect Regulation	Adaptive behaviour, Social skills, Social comm.

				
Brain structure /neurology	Motor skills	Cognition	Language	Academic Achievement
<i>Neurodevelopmental Domains</i>				
				
Memory	Attention	Executive function, Impulse control Hyperactivity	Affect Regulation	Adaptive behaviour, Social skills, Social comm.

# Brain structure/Neurology Domain

- 
- 24% Microcephaly** (~correlates with rate of FAS with 3SFF)
  - 14% Structural brain anomaly** (e.g. thin corpus callosum, optic. N hypoplasia)
  - 8% Neurological abnormalities** (e.g seizure disorder, cerebral palsy)
  - 25% Growth impairment** (*correlates with neurodevelopmental outcomes*)

# Facial features

40% Short palpebral fissures

57% Smooth philtrum

47% Thin upper lip

*Photo analysis software used in 60%*

Demographics

Diagnostic  
patterns

# Demographics

	<b>FASD 2014-17</b>	FAS 2001-04
<b>Age at diagnosis (median)</b>	<b>8.6 y</b> ←	3y
Male:female ratio	1.3:1	1:1
Child protection services ( <i>current/past</i> )	75%	67%
<b>Out of home care (<i>foster/adoptive</i>)</b>	<b>54%</b> ←	38%
Biological parents' care	18%	40%
Grandparents' care	16%	21%
Sibling with FASD	15%	51%
<b>Indigenous</b>	<b>57%</b> ←	65%

WA 70%, 43% elsewhere

3% general population

# Change since previous study 2001-2004

Reporting  
rates  
quadrupled

- 2014-2017: *84 per year*
- 2001-2004: *23 per year*

Incidence  
tripled

- 2014-2017: *1.79 per 100,000 children < 15y*
- 2001-2004: *0.58 per 100,000 (FAS/PFAS only)*

Similar ratio  
3 SFF : <3 SFF

- 1:3
- as expected given what we know about FASD

# Who is diagnosing FASD and how?

**84% diagnosed in specialist FASD clinics / by FASD champions/experts (in MDT teams)**

Specialist FASD clinicians more commonly diagnosing FASD with <3 SFF:

- **7 paediatricians**
- 18% (of 38 reporting paed/s for FASD)
- 0.005% (of 1500 reporting paed/s to APSU overall)

• **82% vs 61%**  $p = .006$

# Where is FASD being diagnosed?

## *State/territory distribution*

Gen population

FASD population

# Reporting patterns: *Discussion*

## **Possible reasons for regional variation**

Differences in drinking patterns in different regions

?Real differences in prevalence

Under vs over diagnoses

Access to diagnostic services

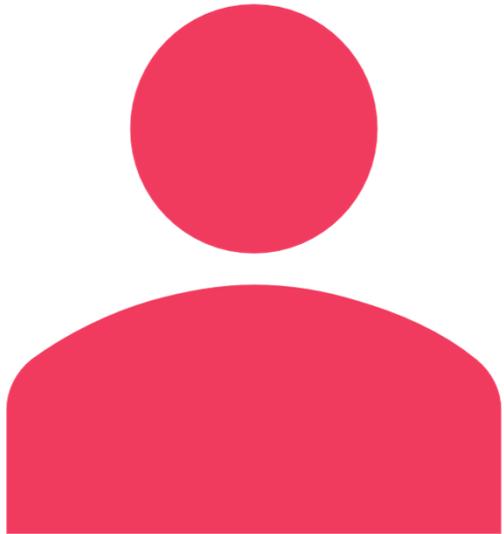

Interests and biases of paediatricians

**? Other clinicians diagnosing**

e.g. geneticists, psychiatrists

*Assessment is challenging, time consuming – partic. for solo clinicians; developmental teams may be under-diagnosing*

# A child diagnosed with FASD in Australia is most likely:

Male

8 years old

In foster/adoptive care

Indigenous

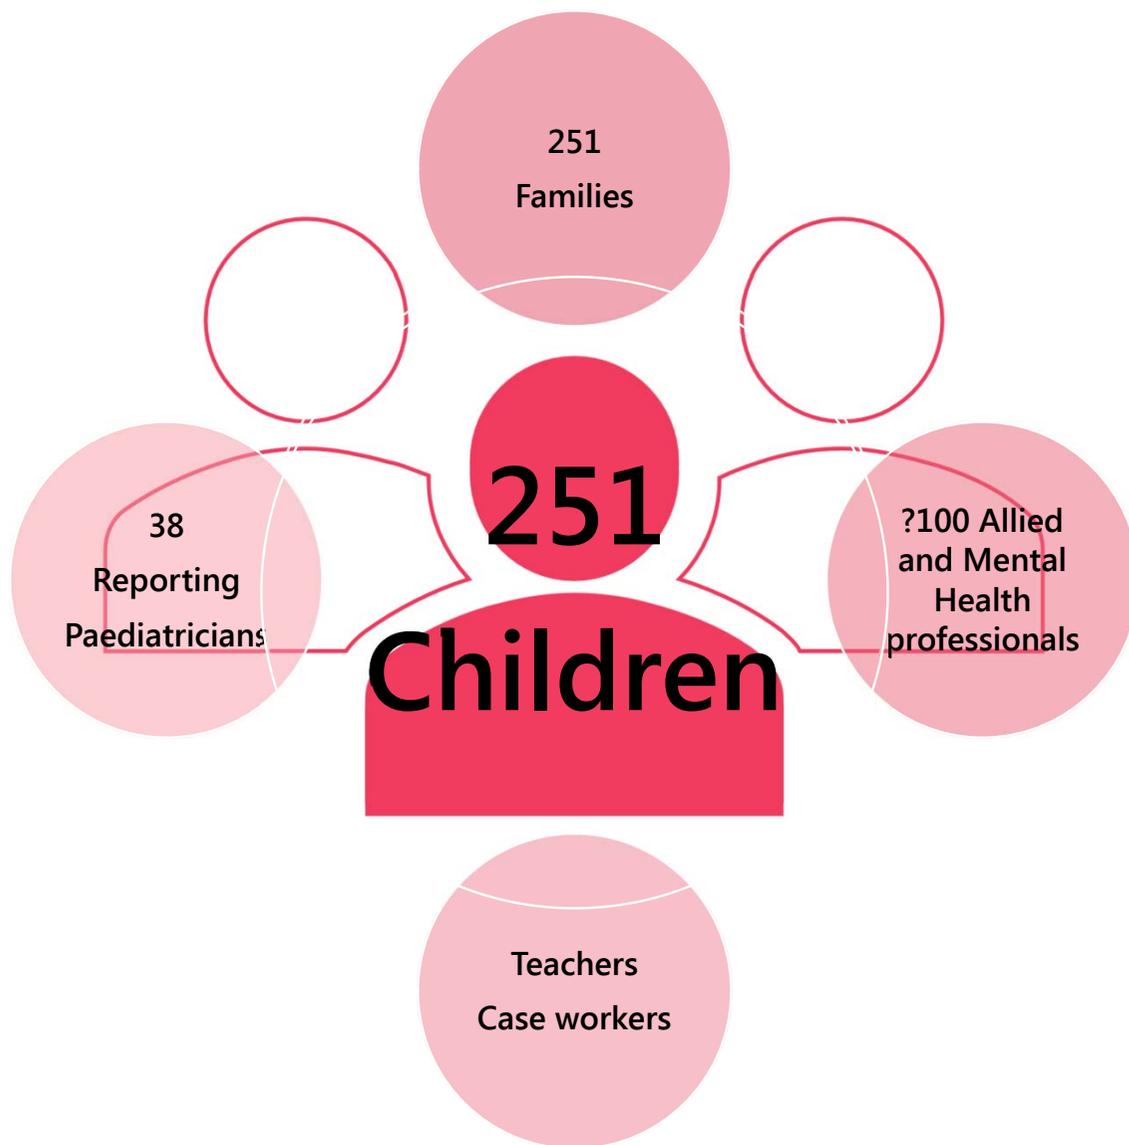

To have:

<3 sentinel facial features

A history of nicotine/polydrug co-exposure

To be diagnosed in:

A specialist FASD clinic  
WA, NSW, or QLD

The lived  
experience  
of this  
study

# Key trends

**FASD diagnosis by Australian paediatricians is *increasing* coinciding with:**

- Establishment of specialised FASD diagnostic clinics
- Availability of national diagnostic guidelines
- Likely reflects better recognition of the FASD spectrum (neurodevelop. impairment in the absence of facial and other physical features) – *the changing face of FASD*

# Interpretation of key trends

## **FASD is likely *underdiagnosed* given:**

High rates of drinking in pregnancy in Australia (40-60%)\*

FASD prevalence internationally (0.8%+)\*\*

## **Over-representation of children in out-of-home care and Indigenous children suggests *underdiagnosis* in:**

Non-Indigenous children

Children living with their birth mother,

\*Muggli E et al. "Did you ever drink more?" A detailed description of pregnant women's drinking patterns. *BMC Public Health*. 2016 Aug 2;16:683.

\*\*Lange S et al. Global Prevalence of Fetal Alcohol Spectrum Disorder Among Children and Youth: A Systematic Review and Meta-analysis. *JAMA Pediatr*. 2017 Oct 1;171(10):948-956

# Limitations & challenges

---

Reporting: Predominance of cases from small group of reporters

---

Variation in use of standardised tools could affect diagnosis:  
e.g for facial features

---

Data gaps: Diagnostic details: eg. psychometric test scores

---

Number of care placements, early life trauma, neglect/abuse

---

Children's strengths

---

# Strengths

---

Novel national/international data set

---

Able to monitor diagnostic trends

---

Platform for national registry

---

Guides service provision, planning, policy & advocacy

---

Educative process for paedS re: FASD

# Disruptive conversations

**About who we are, or are not diagnosing, and why**

About FASD as form of brain injury and reframing our understanding of children accordingly

**About FASD as a common preventable neurodevelopmental disorder/disability, *and opportunities for prevention (e.g. in future siblings) as well as better and early intervention***

**About the impact of alcohol on children in our society more broadly, in all rather than just some communities**

*FASD is not an Indigenous problem*

*And it doesn't just occur in foster children*

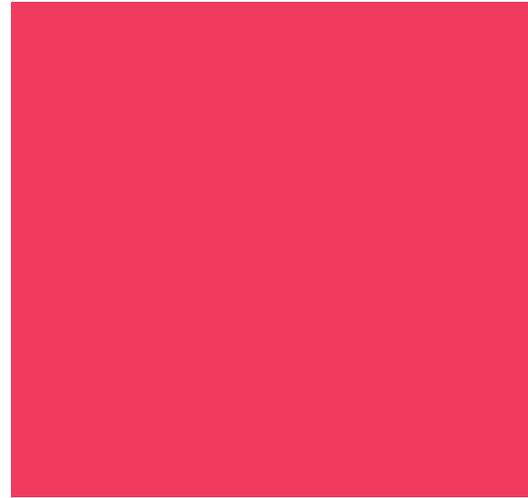

**About understandable barriers, concerns, uncertainties and challenges with diagnosing FASD**

**As the face of FASD changes,  
so does the work of paediatricians.**

**A disruptive  
conversation,  
for a  
healthier  
future.....**

The onus is on us from  
a public health and  
ethical perspective to  
move the conversation  
forward, for the kids  
and families we are  
working for now, and  
those yet to be born...  
– *for a healthier future*

Thank you

..and please  
diagnose &  
report FASD!
