Role of Carnosine in Prevention & Treatment of Obesity and Type 2 Diabetes

Professor Barbora de Courten, MD FRACP PhD MPH

Head, Diabetes and Chronic Disease Prevention Group
School of Public Health and Preventive Medicine
Department of General Medicine, Monash Health

MONASH University MonashHealth Monash Partners Academic Health Science Centre MHTP Monash Health Translation Precinct

Outline

- Burden and risk factors of obesity and type 2 diabetes
- Carnosine - current evidence
    - animal studies
    - human studies
- Our clinical trials on carnosine and cardiometabolic health
- Conclusions

Burden and risk factors for obesity and type 2 diabetes

Burden of obesity and type 2 diabetes

- 60% of adult Australians overweight or obese
- 22% of Australians > 25 years have prediabetes or type 2 diabetes
- 80% obese patients with type 2 diabetes develop cardiovascular disease
- annual healthcare costs cca 9 billion

Walls, *Obesity* 2012
Chen, *Nat Rev Endocrinol* 2012
Zimmet, *Nature* 2001

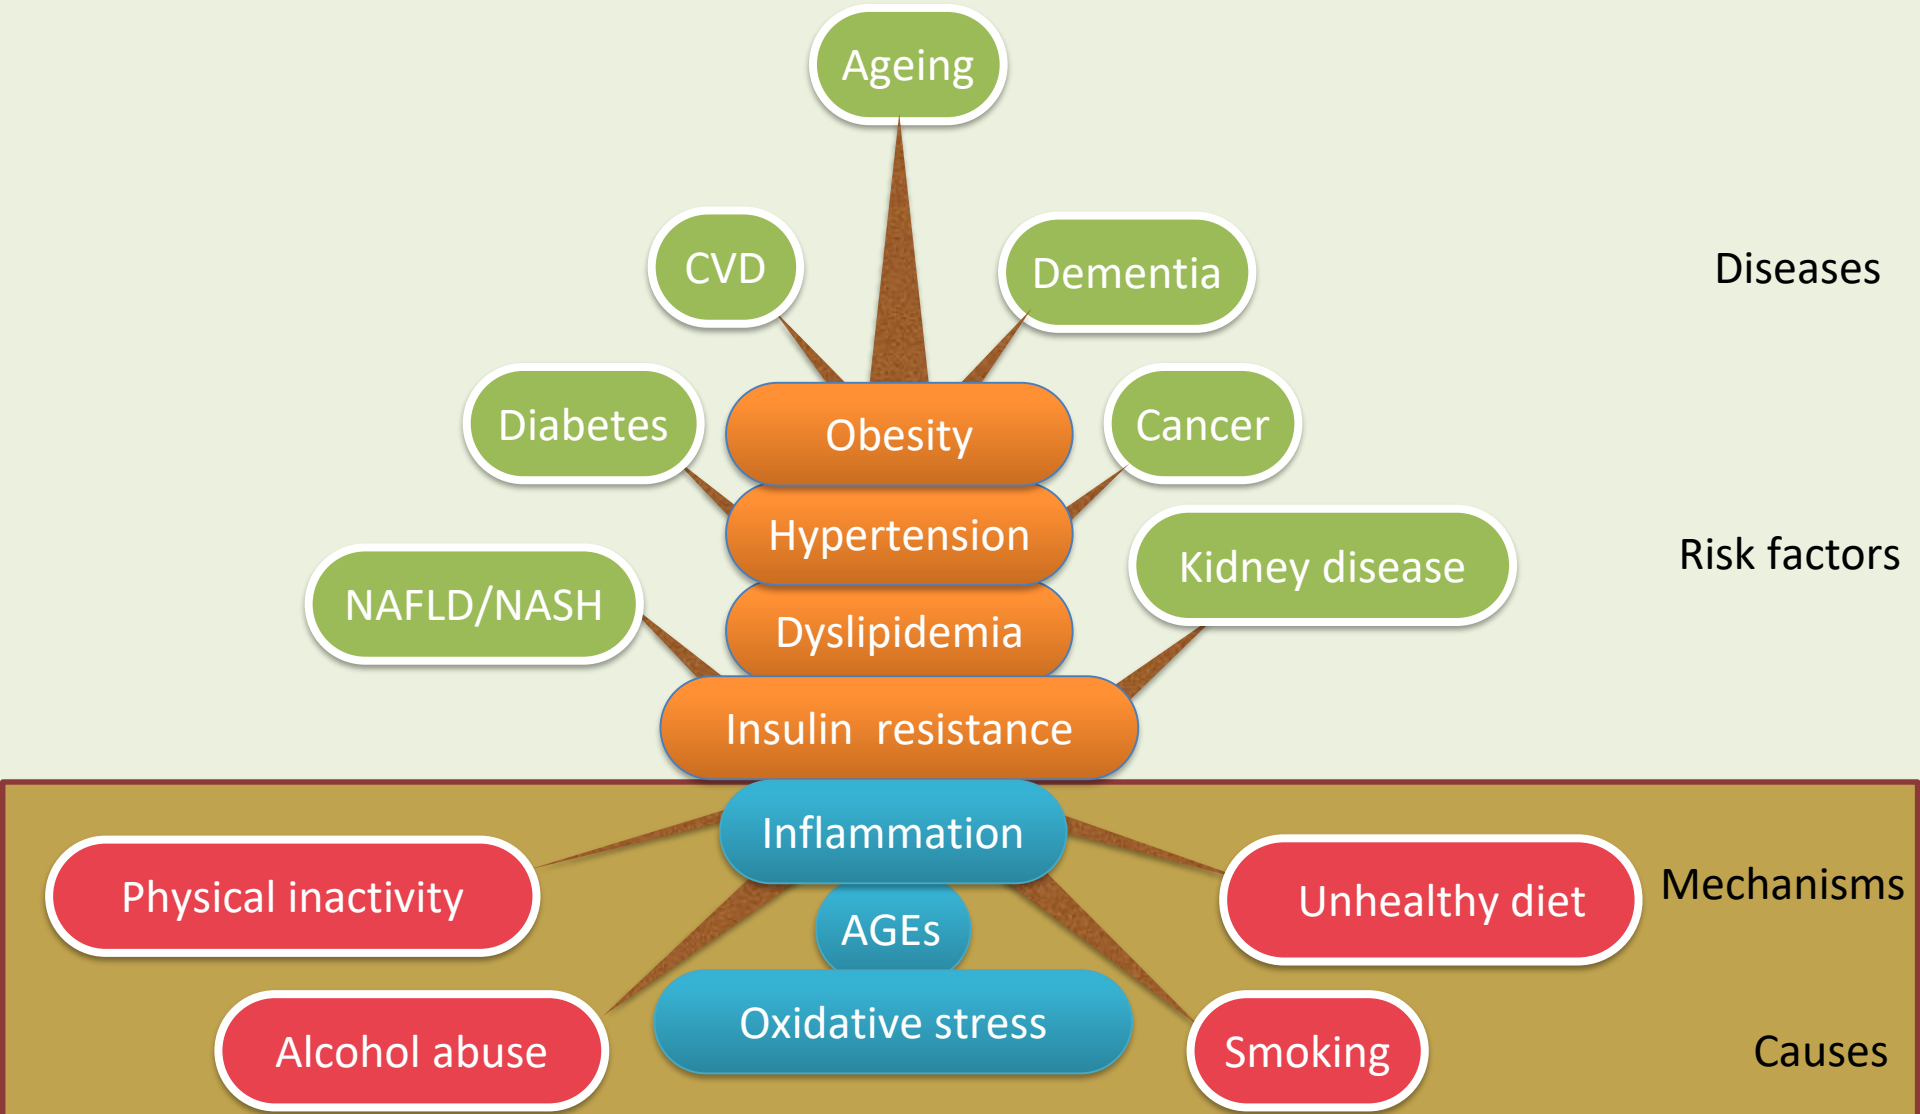
Risk factors for obesity and type 2 diabetes

- multiple risk factors
- shared with other chronic diseases (cardiovascular diseases, dementia, depression, cancer, ageing)
- long latency - amenable to prevention

The ideal preventative strategy/intervention:

- prevents multiple risk factors and therefore diseases
- impacts mechanisms of diseases
    - lifestyle intervention (diet & exercise)
- synergistic with exercise

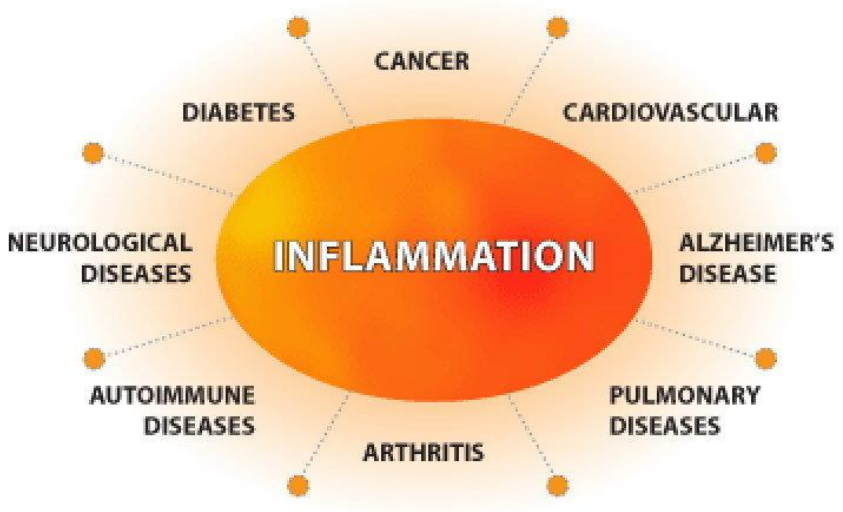
Tree of chronic diseases



My Research Focus

Identifying and providing evidence for interventions applicable for prevention of diabetes and related chronic diseases, that are…

- safe
- low cost
- easily scalable
- immediate public health impact



- diets and supplements
  - cheaper
  - low side effect profile
  - no need for regulatory approval
  - good quality trials are often missing

Why carnosine ?

What is carnosine?

Beta-Alanine L-Histidine

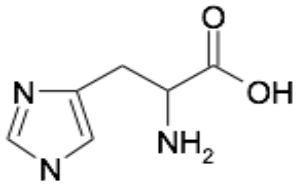
Main dietary sources: 50 to 250 mg/dL

Red meat

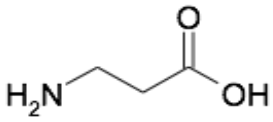
Whale meat

Fish

Histidine

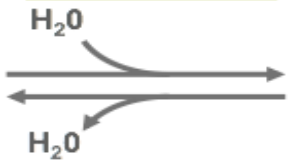


β-Alanine



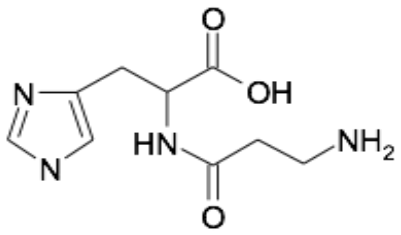
Carnosine-Synthase

H_2O



H_2O

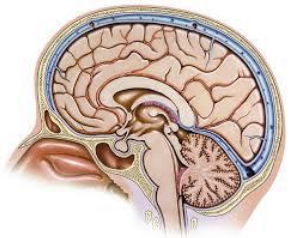
Carnosinase



CN1 – plasma
CN2 – gut

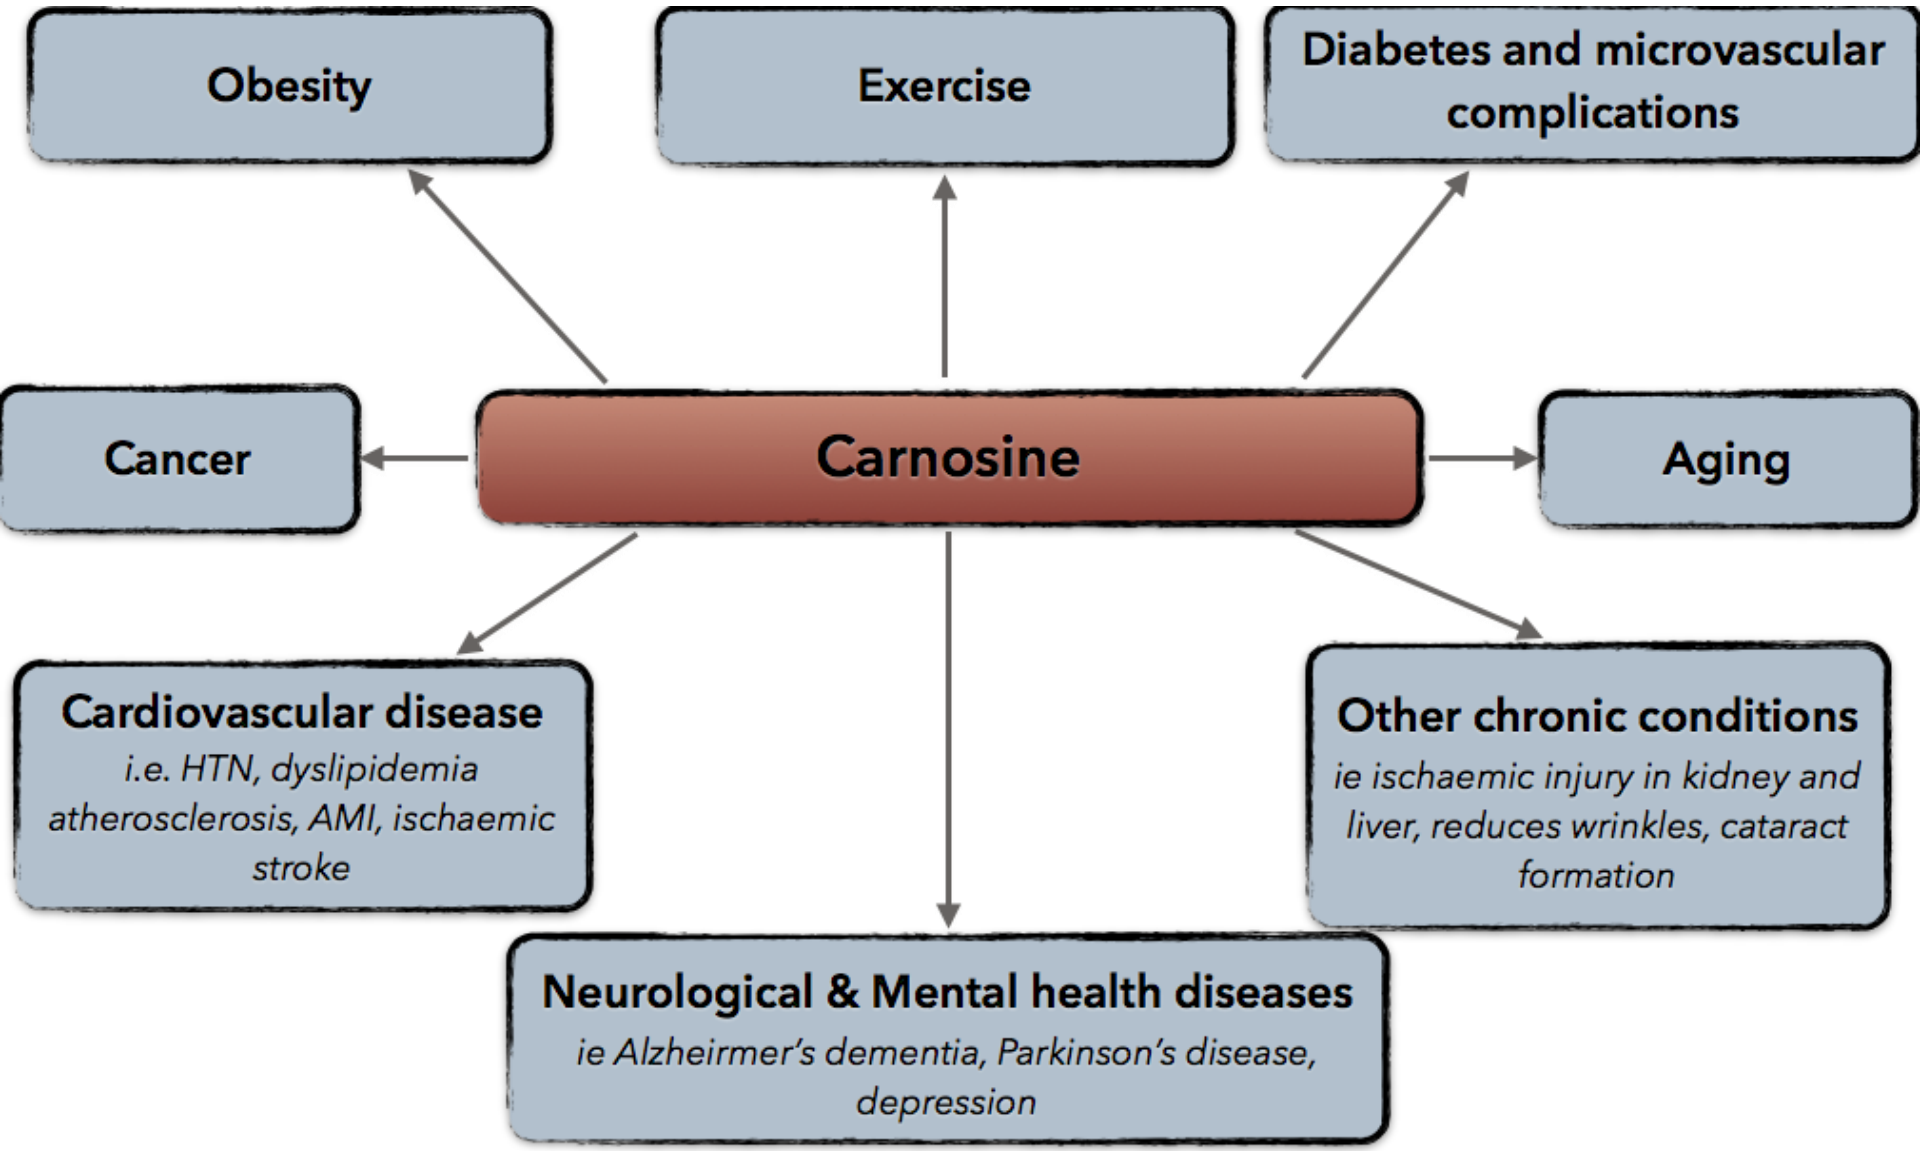
What is carnosine?

- naturally occurring dipeptide (beta-alanine L-histidine) in humans
  - cardiac & skeletal muscle, brain tissue
  - first described in 1900
  - first appeared around a decade ago - food supplements and skin creams
  - advertised an elixir of youth
  - yet little human research



- carnosine supplement:
  - water soluble powder
  - safe
  - 0.5-3.5g necessary for biological effects
  - low cost (1AUD$ per day)

Carnosine - Magic Bullet for Chronic Diseases?



Mechanism of Action of Carnosine

- ⬇ chronic low-grade inflammation
  Yan, 2009; Tsai, 2010; Lee, 2005

- ⬇ oxidative stress
  Hipkiss, 2011; Ma, 2012

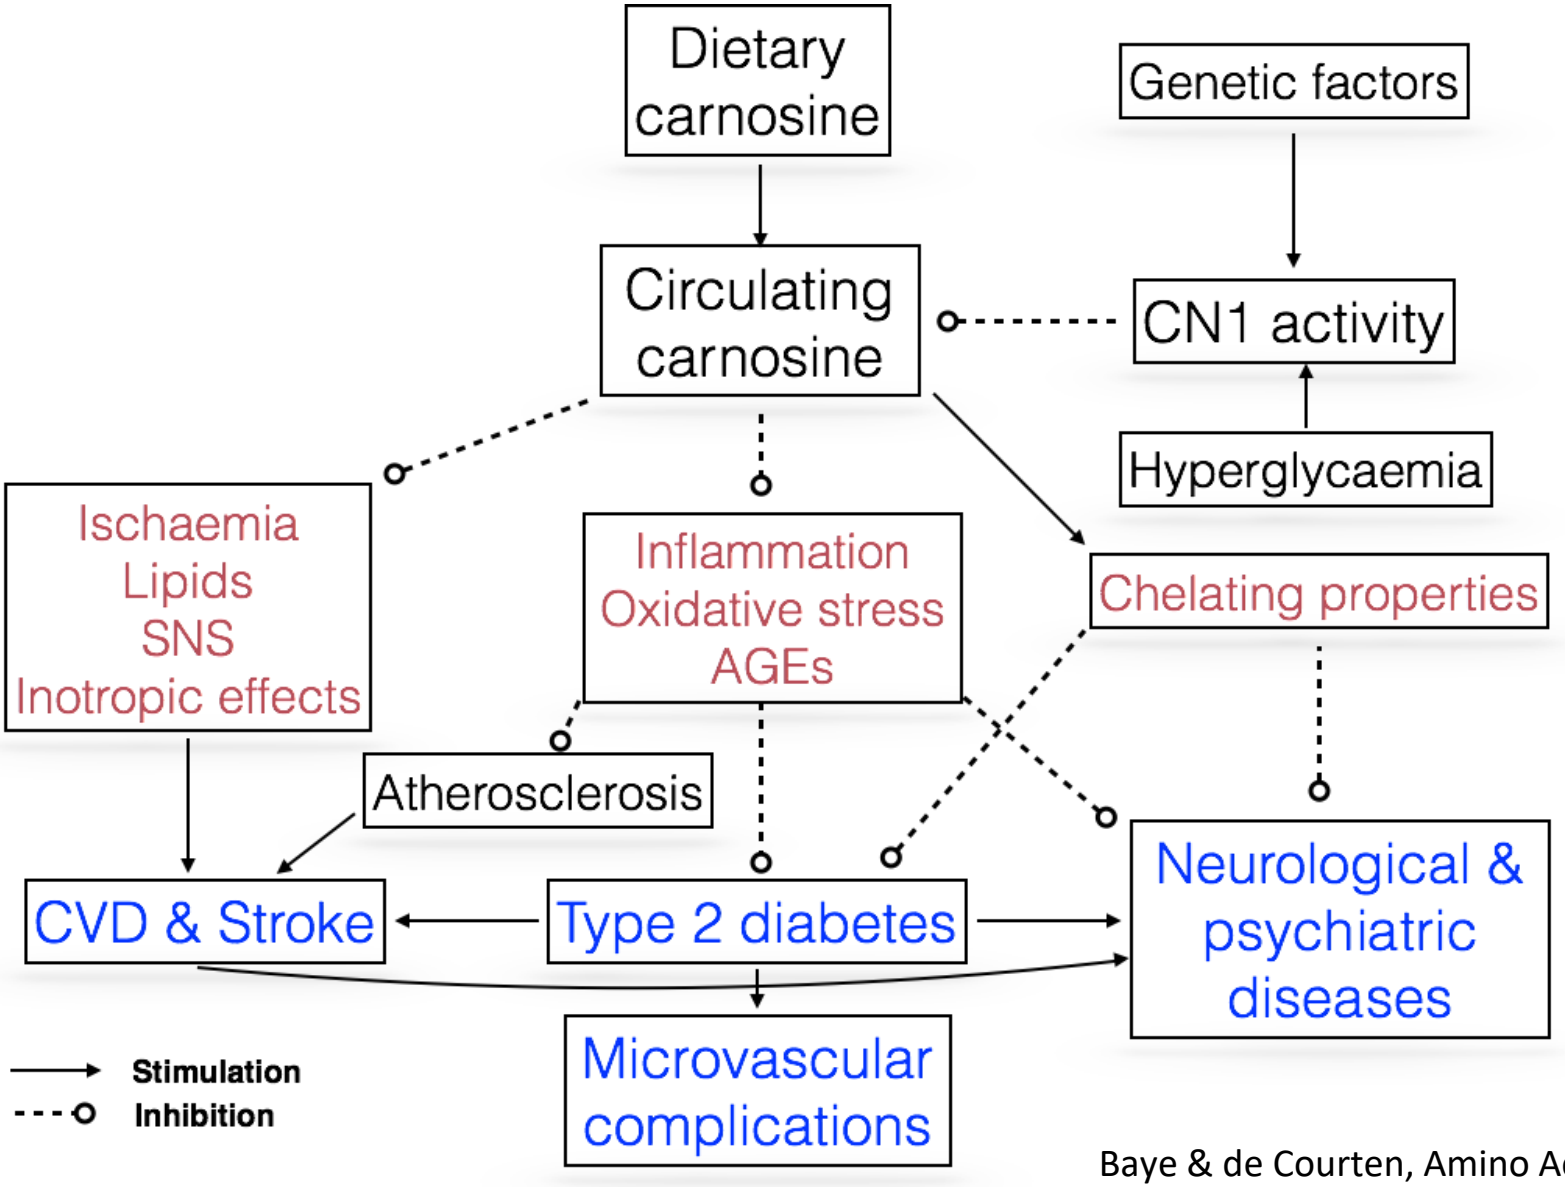
- ⬇ advanced glycation (AGEs)
  Burcham, 2002; Hipkiss, 2002

- chelating properties
  Price, 2001; Arnal, 2011

- ⬇ ischemia
  Doborota, 2005; Fujii, 2005

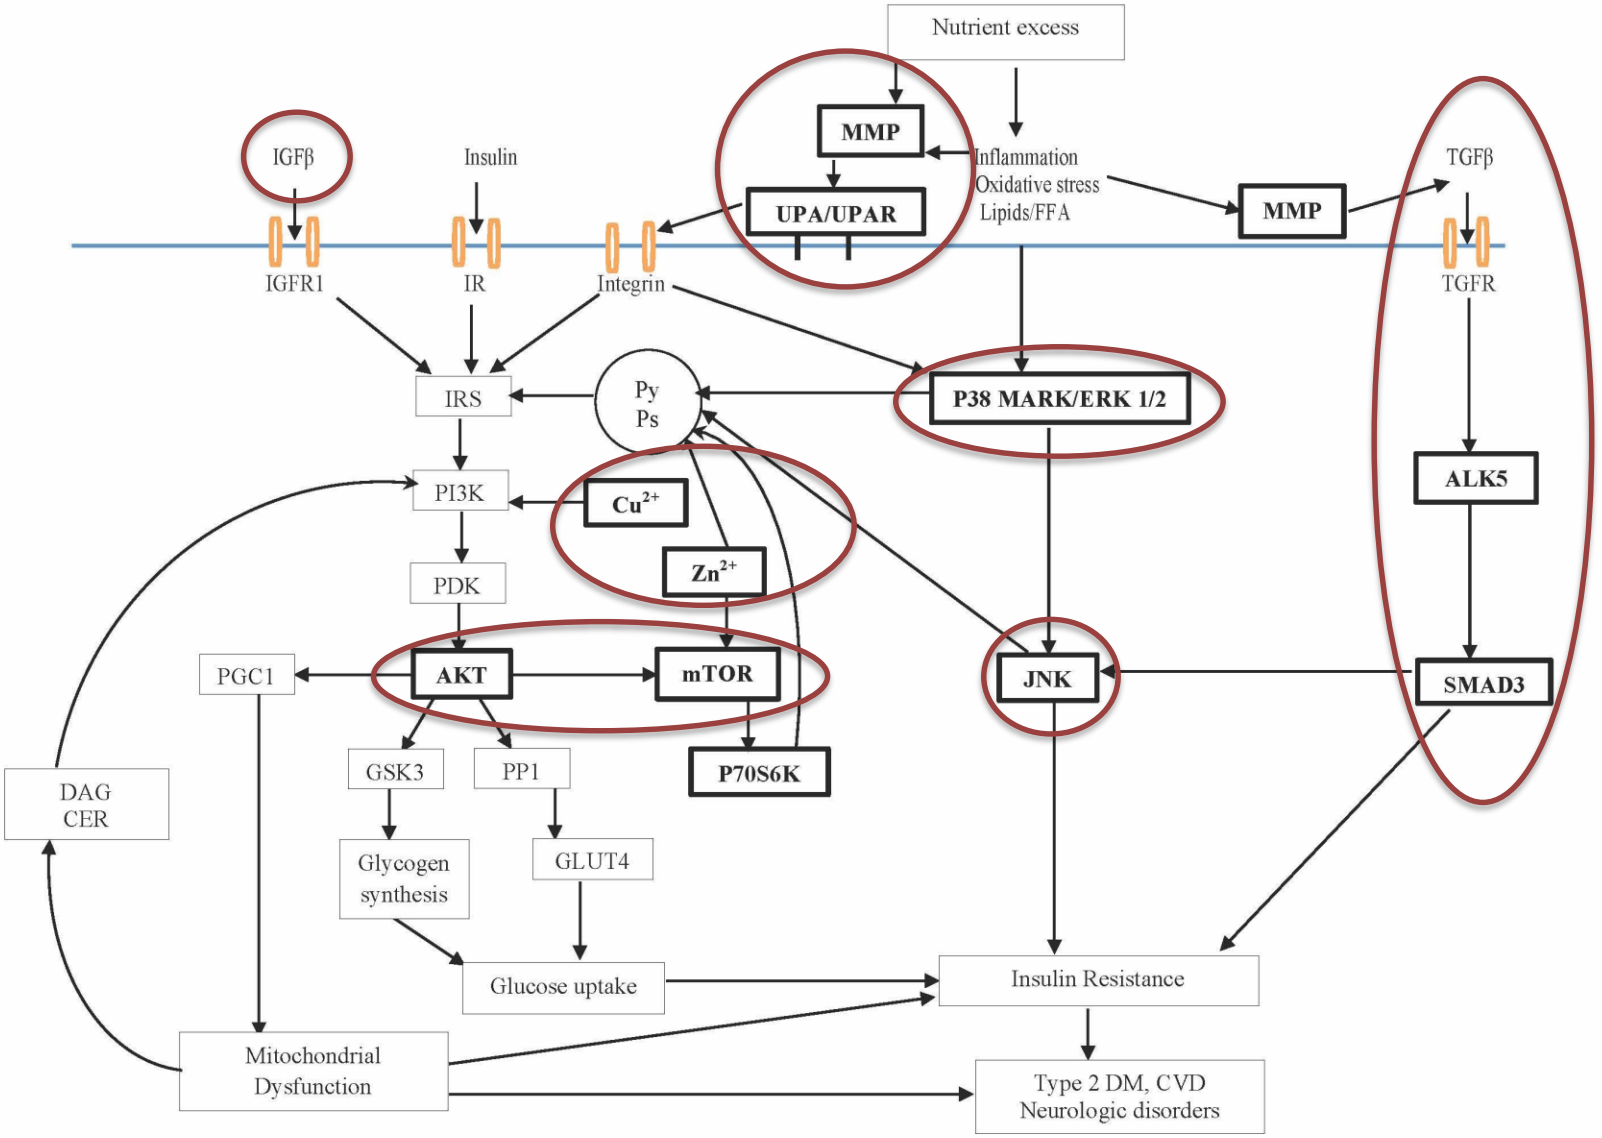
- ⬇ sympathetic nervous system activity
  Nagai, 2012; Horii, 2012

How could it all work?



Baye & de Courten, Amino Acids, 2016

Carnosine & signalling



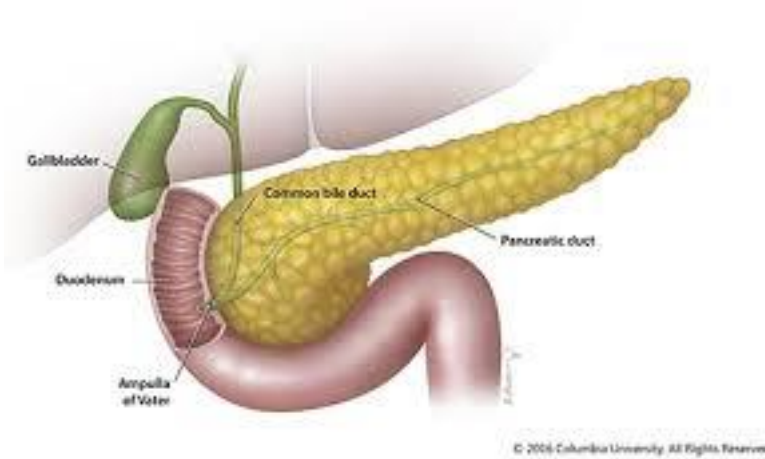
Baye & de Courten, Amino Acids, 2016

Evidence from animal studies

Carnosine, obesity and type 2 diabetes (rodents)

Carnosine reduced

- weight
- insulin levels
- insulin resistance
- delayed development of diabetes
- glucose levels in animals with diabetes
- inflammation and oxidative stress



Aldini G, 2011; Mong, 2011; Sauerhofer, 2007; Lee YT, 2005

MCHRI
Monash Centre for Health Research and Implementation

Carnosine and cardiovascular disease (rodents)

Carnosine supplementation reduced

- cholesterol and triglycerides in plasma and liver
- oxidation and glycation of LDL (foam cell formation)
- atherosclerosis
- ischaemic effects

Aldini, 2011; Brown, 2014; Barski, 2013; Mong, 2011; Rashid, 2007; Lee YT, 2005

MCHRI
Monash Centre for Health Research and Implementation

Evidence from human studies

Carnosine supplementation improves exercise performance

↑ exercise capacity compared to placebo

- Hobson, 2012 (meta-analysis)

↑ high-intensity anaerobic performance

- Artioli, 2010

Mechanisms

- ↑ muscle buffering capacity, ↓ lactate
  - Swietach, 2014
- improvement in calcium handling and antioxidant capacity
  - Sale, 2013
  - Dutka, 2004

MCHRI
Monash Centre for Health Research and Implementation

Health benefits of carnosine supplementation in humans

Health benefits of carnosine	Study design	Daily doses	Duration
Improved balance (foot up and go test) and physical performance in the elderly (Szczesniak et al. 2014)	Randomsied placebo controlled trial	1 g	13 weeks
Improved exercise capacity and time to exhaustion in the elderly (del Favero et al. 2012)	Randomsied placebo controlled trial	3.2 g	12 weeks
Improved exercise capacity and high-intensity exercise greater than 60 s (Hobson et al. 2012)	Meta-analysis	1.79 g (average)	
Reduced fasting insulin Decreased insulin resistance Reduced insulin secretion in healthy overweight and obese humans (De Courten et al. 2015a)	Randomsied placebo controlled trial	2 g	12 weeks
Improved quality of life Increased end-diastolic volume Improved physical performance (as measured by 6 min walk test and VO_{2max}) (Lombardi et al. 2015)	Randomised controlled trial	0.5 g	6 months
Improved cognitive performance			
In young healthy soldiers (Hoffman et al. 2015)	Randomsied placebo controlled trial	6 g	1 month
In elderly individuals (Szczesniak et al. 2014)	Randomsied placebo controlled trial	1 g	13 weeks
Improved neurological symptoms such as leg agility and motor examinations in patients with Parkinson's disease (Boldyrev et al. 2008)	Randomised controlled trial	1.5 g	1 month
Improved the executive function and strategic efficiency Reduced perseverative errors in schizophrenic adults (Chengappa et al. 2012)	Randomsied placebo controlled trial	2 g	3 months
Improved receptive speech, socialisation and behaviour in children with autistic spectrum disorders (Chez et al. 2002)	Randomsied placebo controlled trial	800 mg	8 weeks
Ameliorated cognitive impairment in veterans with Gulf War Illness (Baraniuk et al. 2013)	Randomsied placebo controlled trial	1.5 g	12 weeks

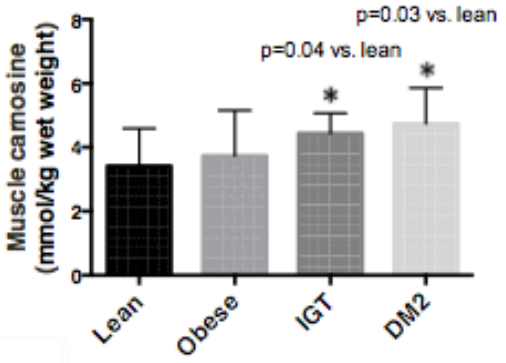
Baye & de Courten, Amino Acids, 2016

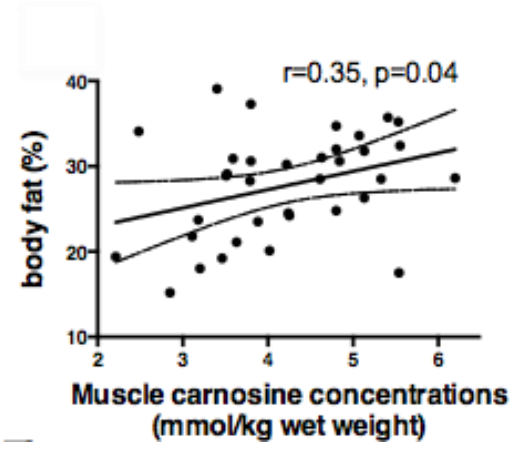
Muscle carnosine content & glucose metabolism (cross-sectional study)

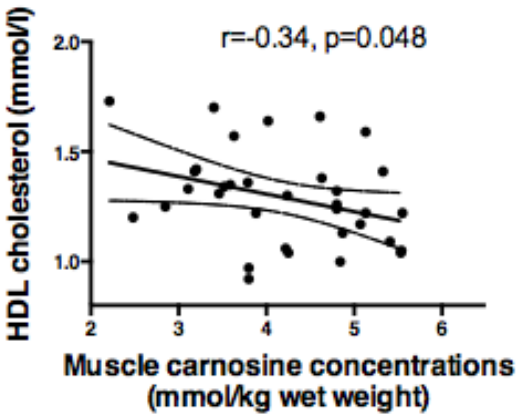
Muscle carnosine increases with worsening

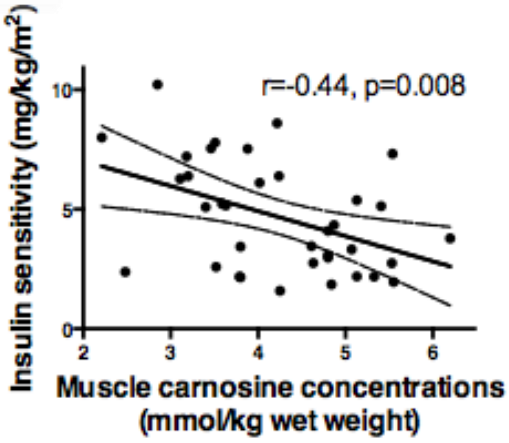
- obesity
- dyslipidemia
- glucose intolerance
- insulin resistance

n=9 lean n=9 obese n=9 IGT n=9 T2DM









de Courten, Ukropcova, PLoS ONE, 2015
Stegen, de Courten, PLoS ONE, 2015

Carnosine & Diabetes

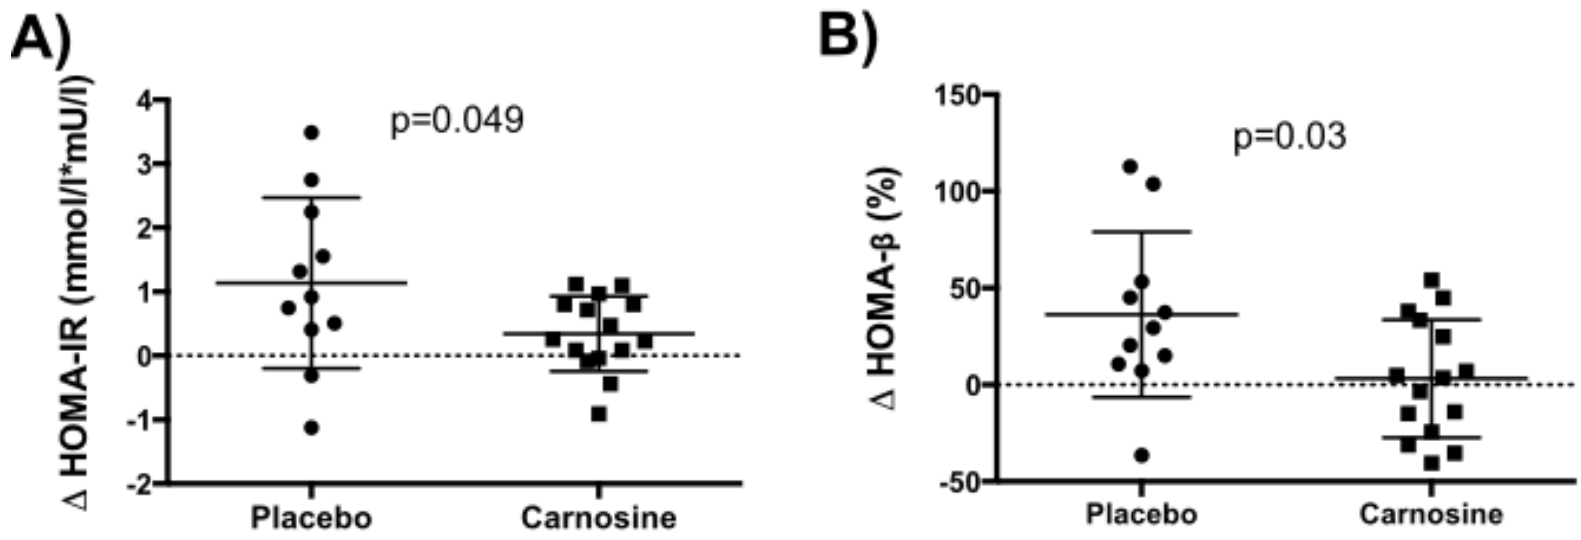
- ↑ muscle carnosine content in drug-naïve patients with type 2 diabetes compared to healthy controls
    - Srikanthan, 2012

- ↓ muscle carnosine levels in patients with type 2 diabetes (on glucose lowering therapy) compared to healthy controls
    - Gualano, 2012

MCHRI
Monash Centre for Health Research and Implementation

Carnosine supplementation & diabetes risk

RCT: 12-week intervention with 2g/day carnosine vs placebo



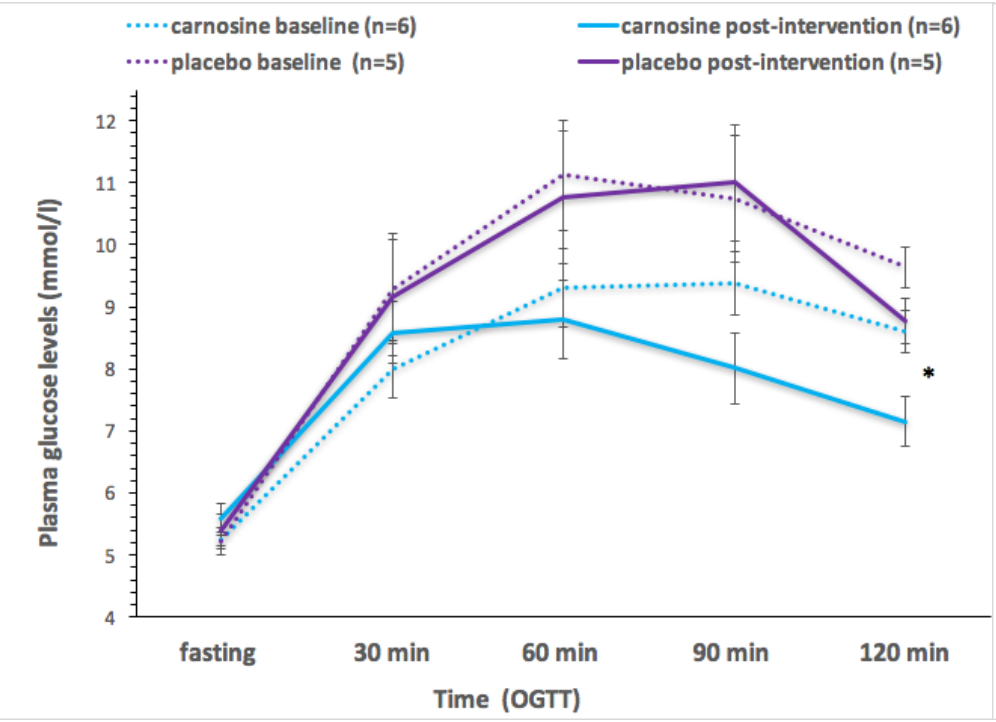
Pilot trial

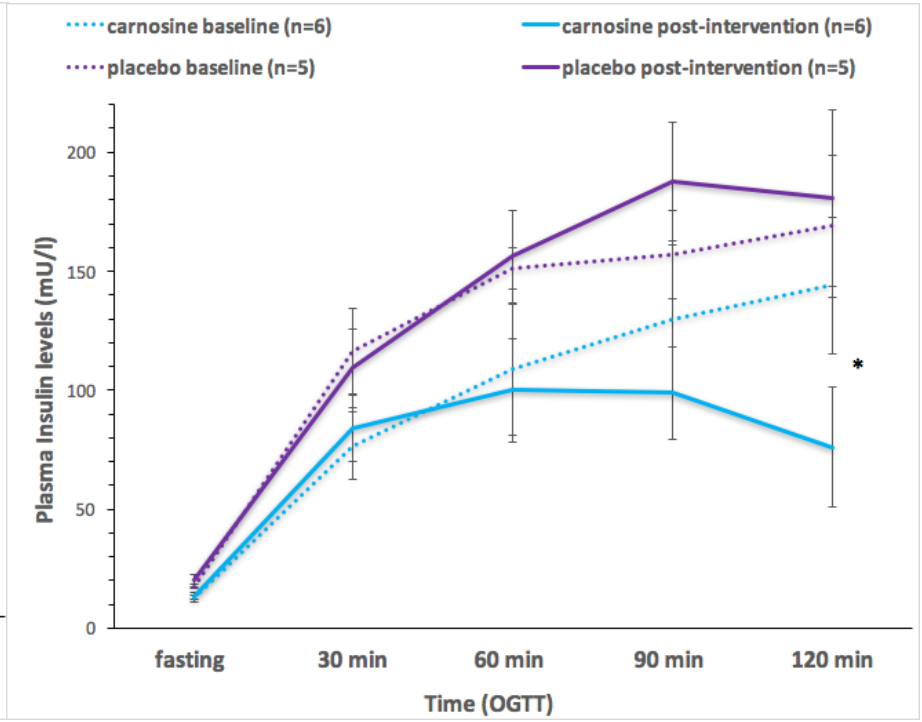
Carnosine supplementation prevents

- **decrease in insulin sensitivity**
- **increase in insulin secretion**
- **no change in inflammation markers**

de Courten et al, Obesity, 2016

Carnosine improves glucose and insulin levels during OGTT in patients with impaired glucose tolerance





* P<0.05

de Courten et al, Obesity, 2016

RCT in patients with prediabetes with carnosine compound

Ingredient	Dietary supplement (Quantity per capsule)	Placebo (Quantity per capsule)
Extract of cinnamon	228.00 mg	-
L-carnosine	100.00 mg	-
Chromium guanylate	1.25 mg (10 μg chromium chloride)	-
Excipients		
Silica	16.00 mg	-
Talc	7.00 mg	7.00 mg
Magnesium stearate	6.00 mg	6.00 mg
Hydrated silica	5.00 mg	5.00 mg
Silicon dioxide	-	16.00 mg
Microcristalline cellulose	-	230.25 mg
Clear transparent HPMC capsule	95.00 mg	95.00 mg
Total	**595 mg**	**496 mg**

N=52, obese individuals with prediabetes
Intervention: 4 months

Liu et al, Plos One, 2015

Carnosine - Summary

MCHRI
Monash Centre for Health Research and Implementation

- food supplement
- safe
- water soluble and easy to mix in foods
- anti-inflammatory, anti-oxidative, anti-AGE, chelating properties and effects on SNS
- all effects are important for many chronic diseases
- ?additive effect with exercise
- compelling evidence from animal studies (2000 animal studies)
- paucity of human data
- need for well designed clinical trials if proven beneficial - potential use for primary prevention many chronic diseases as well as add-on to standard therapy

Gaps in the evidence

Different doses

Mixed supplements

Different populations

Lack of gold-standard methods

Carnosine supplementation in overweight and obese individuals and patients with IGT and type 2 diabetes

Hypothesis

We hypothesise that carnosine supplementation in overweight and obese individuals (Study 1) and patients with IGT and T2DM (Study 2) will improve:

- diabetes risk factors (Study 1) or glycaemic control (Study 2)
- cardiovascular risk factors
- cognitive outcomes

and this will be modulated by reduction in chronic low-grade inflammation, oxidative stress and circulating AGE levels.

Participants & Methods

- **participants:**
  - 84 overweight and obese individuals (Study 1)
  - 52 adult patients with impaired glucose tolerance and T2DM (Study 2)

- **design**: double blind placebo randomised controlled trials
- **intervention**: 1g carnosine BD or matching placebo
- **length of intervention**: 14 weeks
- **measurements**: before and after intervention

Inclusion criteria

- Study 1:
  - Overweight and obese individuals
  - Age 18-60 years
- Study 2:
  - Patients with IGT or T2DM (diet controlled and on Metformin only)
  - Age 18-70 years
  - Stable dose of metformin for least 3 months

- No significant change in weight in last 6 months
- No intention to loose weight during the course of the study

Exclusion criteria

- HbA1c level > 8% for patients with diabetes
- Morbid obesity (>40 kg/m2) - DEXA limitation
- Taking other glucose lowering medications than metformin including injectables
- Taking regular anti-inflammatory medications or supplements potentially effecting glucose metabolism
- current smoker or high alcohol/recreational drug use

Exclusion criteria

- Significant other chronic diseases and psychiatric disorders
- Presence of acute inflammation
- Pregnant or lactating
- Not speaking English (need to complete cognitive function tests - time)

Outcomes

Obesity

- % body fat
- FFM
- IMAT
- Steatosis
- Diet
- Exercise

Diabetes

- insulin sensitivity
- insulin secretory function
- glucose tolerance
- ACR

CVD

- Lipids, lipidomics
- arterial stiffness
- blood pressure / cBP
- endothelial function
- HRV

Cognition

- CANTAB+
- depression
- sleep

-inflammation in plasma and PBMC, oxidative stress, advanced glycation and lipidoxidation end products

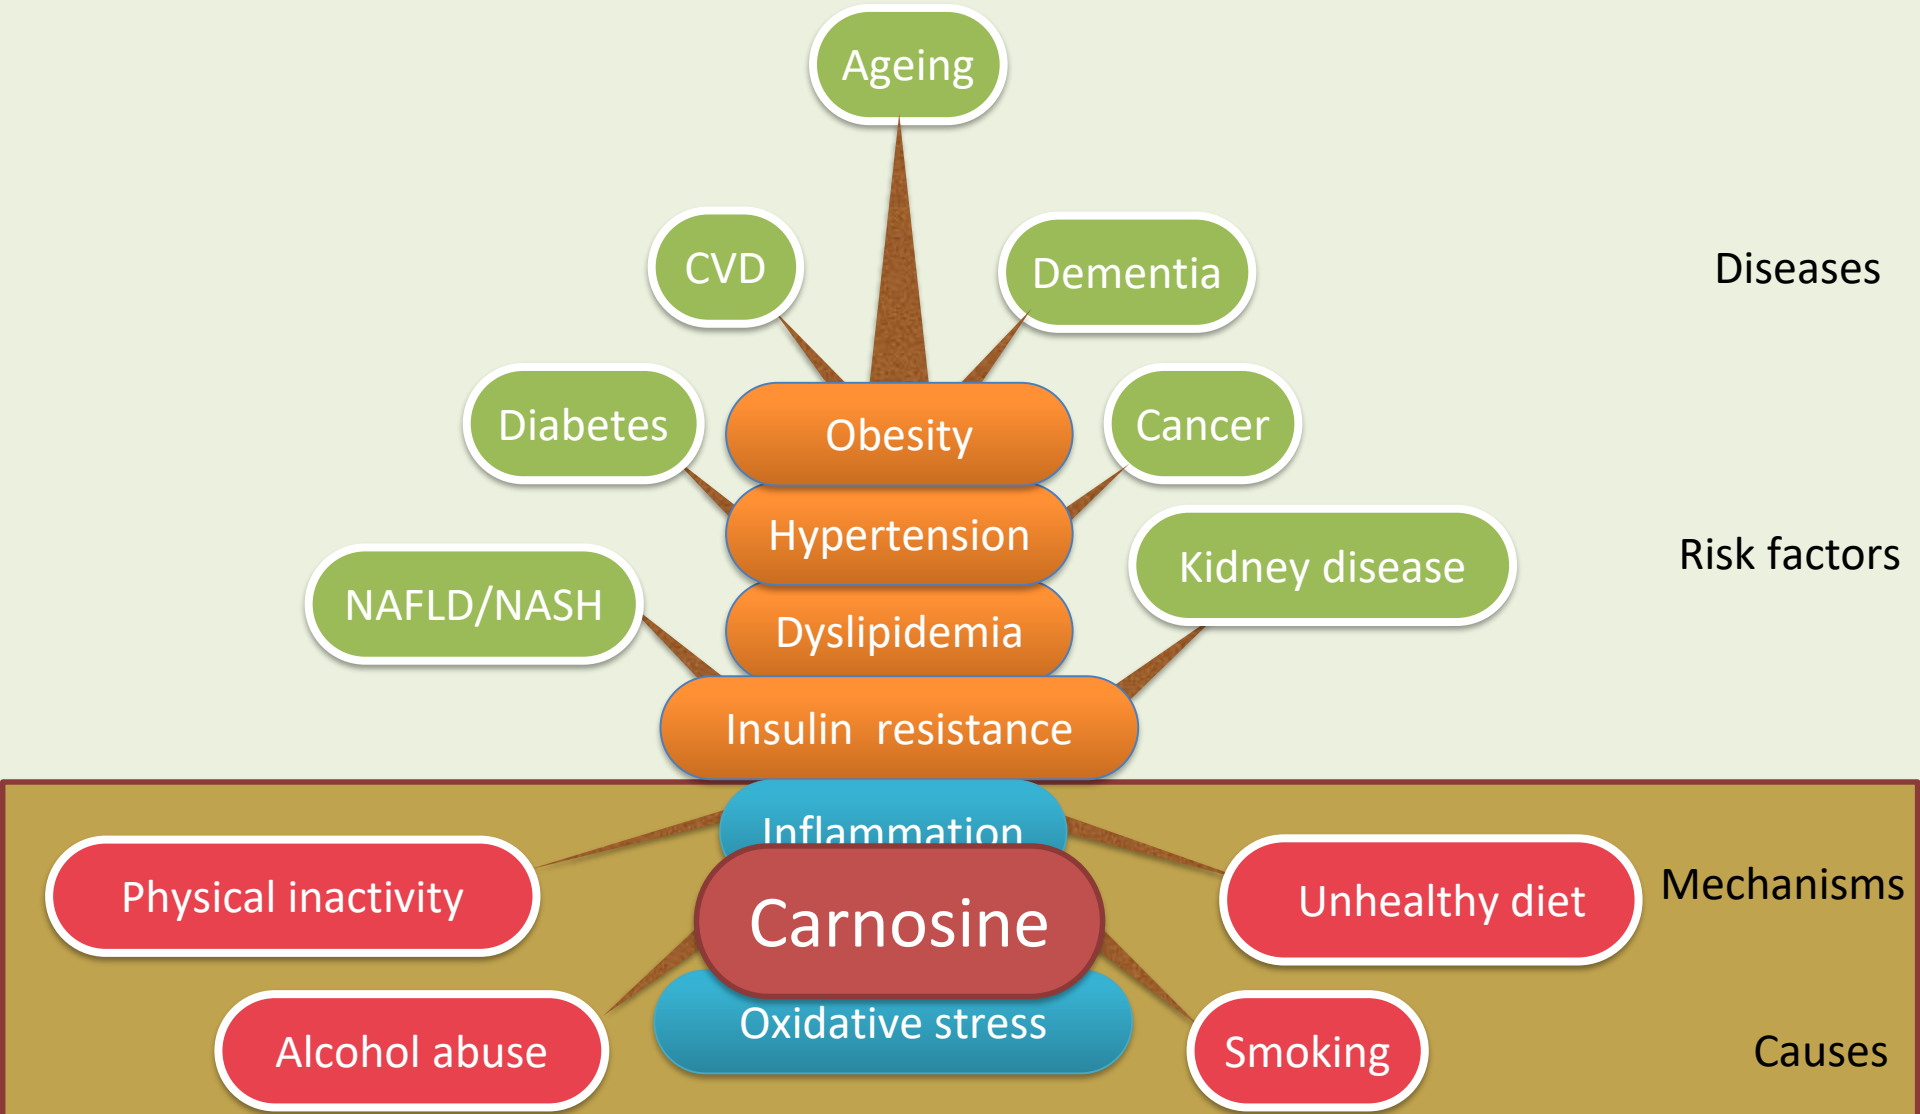
-signalling muscle tissue

-microbiome

-DNA – ageing markers ie telomere length, telomerase

MCHRI
Monash Centre for Health Research and Implementation

Tree of chronic diseases



Conclusions

Carnosine:

- **cheap**
- **low side effect profile**
- **? additive effect with exercise**
- **no need for regulatory approval**

- **good quality RCTs needed to show IF there is health benefit**
- **IF it effects mechanisms which are applicable to several chronic diseases**

Interested to do PhD?

- What you will learn:
  - Systematic review and meta-analysis
  - Clinical trial methodology
  - Gold standard methodologies for assessment of diabetes and cardiovascular risk factors
  - Health economic analyses
  - Average number publications in a PhD is 15
