

## Sexual Health Medicine Advanced Training Record of Cases

	Date	Age of Patient	Diagnosis or Condition	Management/Reflections/Outcomes
1.	[REDACTED]	40 M	HIV	<p>1. HIV infection</p> <ul style="list-style-type: none"> <li>- Diagnosed 2008</li> <li>- Fully susceptible virus</li> <li>- Currently on Truvada (TDF/FTC), Atazanavir/ritonavir</li> <li>- VL &lt; 40 (undetectable), CD4: 1,590 (43%)</li> </ul> <p>2. Helicobacter infection</p> <ul style="list-style-type: none"> <li>- Diagnosed on biopsy after gastroscopy</li> <li>- Requires eradication therapy</li> </ul> <p>3. Hypertriglyceridemia</p> <p>Reflection:</p> <p>H. pylori eradication therapy includes the use of proton pump inhibitors (PPIs). Coadministration of atazanavir with proton pump inhibitors is not recommended. No data are available with esomeprazole; lansoprazole decreased atazanavir AUC by 94%, omeprazole decreased atazanavir AUC by 75%. If coadministration is judged unavoidable, close clinical monitoring is recommended and doses of proton pump inhibitors comparable to omeprazole 20 mg should not be exceeded and must be taken approximately 12 hours prior to the atazanavir/ritonavir. The European SPC recommends increasing the dose of atazanavir to 400 mg with 100 mg of ritonavir.</p> <p>Management:</p> <p>Given that he has no viral resistance mutations as well as his hypertriglyceridemia, the decision was made to cease his protease inhibitor (PI) treatment and change him over to an integrase inhibitor combination which does not have the drug-drug side effects with PPIs and may have a more favourable effect on his lipid profile. He was changed over to Truvada and Dolutegravir with no loss of viral control and no side effects. He completed his H. pylori eradication therapy with good results and remains on Truvada/DTG.</p>
2.	[REDACTED]	68 M	HIV	<p>HIV</p> <ul style="list-style-type: none"> <li>- diagnosed 1996</li> <li>- no physical follow up since 2009</li> <li>- last bloods - undetectable viral load, CD4: 710 (29%)</li> <li>- on Kivexa (abacavir &amp; lamivudine) &amp; Nevirapine</li> <li>- reports no problems with meds, although has multiple CVS risk factors</li> </ul>

2. Hypertension  
- untreated

3. T2DM  
- untreated

4. Dyslipidaemia  
- untreated

Non smoker

Not prepared to see GP in hometown (has falling out with the only GP there). Has a lot of difficulty getting to see a GP. Finds it really hard to come to our clinic for HIV review visits.

Reflection:

1. People living with HIV (PLWHIV) still continue to experience perceived discrimination from some healthcare professionals, resulting in barriers to accessing primary care. This results in the potential for other chronic medical problems to remain untreated.
2. In March 2008 the D:A:D study, a collaboration of eleven prospective cohorts from across Europe, Australia, and the US, totalling over 30,000 participants, first published results showing an almost doubled risk of heart attack in people taking abacavir. While subsequent updates from D:A:D and some other studies have also found evidence of a link between abacavir and heart attacks, some other studies, including a meta-analysis by the US Food and Drug Administration, have found no evidence of increased risk. D:A:D's own evidence suggests the increased risk is only significant in people who already have risk factors for a heart attack, a finding possibly confirmed by some studies that show abacavir is associated with inflammatory changes in the blood vessels that are also associated with HIV infection itself. Other studies have failed to find such changes, however, or have found that traditional risk factors for heart attack lie behind the apparent increase in risk associated with abacavir. In this particular case I have consulted with my supervisor as well as the ID team. The consensus was made that starting to address all of his CVS risk factors prior to initiating a change from Abacavir would take priority.(1)
3. His CVS risk factors were optimised and we have chosen to change his cART to a tenofovir/emtricitabine backbone. This does not have the increased CVS risk associated. We will monitor his urine protein/creatinine ratios, along with his renal functions closely to watch for the potential renal side effects of tenofovir disoproxil fumarate (TDF). Tenofovir alafenamide (TAF) does not have these renal or osteopaenia side effects and therefore, he was changed onto TAF as soon as it became available. The Integrase Inhibitor, raltegravir (RTG) was chosen due to its little

				<p>drug-drug interactions in this case.</p> <p>4. His CVS risk factors are now well controlled. His HIV infection is also well controlled on Descovy/RTG.</p> <p>Reference:  1. Sabin C et al. Is there continued evidence for an association between abacavir and myocardial infarction risk? 21st Conference on Retroviruses and Opportunistic Infections, Boston, abstract 747LB, 2014.</p>
3.		46 M	HIV	<p>HIV</p> <ul style="list-style-type: none"> <li>- diagnosed in 1998</li> <li>- poor compliance history</li> <li>- last on ART in 2011</li> <li>* Truvada (TDF/FTC), Atazanavir, Ritonavir</li> <li>- GRA in April 2010 showed</li> <li>* High level resistance to: <ul style="list-style-type: none"> <li>- 3TC, FTC, DLV, EFV, NVP</li> </ul> </li> <li>* Low level resistance to: <ul style="list-style-type: none"> <li>- ETR</li> </ul> </li> <li>* Potential low-level resistance to: <ul style="list-style-type: none"> <li>- ABC</li> </ul> </li> <li>* NRTI mutations: M184V, K219KR</li> <li>* NNRTI mutations: K103N, P225H</li> </ul> <p>HLA B57-01: excluded</p> <p>Current results:  CD4: 40 (3%)  VL: 510 498</p> <p>No current symptoms of opportunistic infections</p> <p>Plan:</p> <ul style="list-style-type: none"> <li>- Restart ART</li> <li>- Bactrim prophylaxis.</li> <li>- Extensive resistances tricky with pill burden. No single FDC will be OK as resistance to FTC / 3TC so both Kivexa and Truvada probably not OK.</li> </ul> <p>Could risk Kivexa / Atazanavir, but only 2 active drugs and already resistant. If not an issue from interaction POV, might be better to use Triumeq + Boosted ATV.</p>

				<p>Commenced on Triumeq, ATV/rit.          Biochem in 2 weeks.          Review with VL in 6 weeks.          To call before if any problems.</p> <p>At 6 weeks follow up:          Routine biochem all fine.          No problems with tablets.          No IRIS          CD4 170          VL 317 (only a couple of months after restarting) - Repeat Viral Load in 1 month.</p> <p>Repeat viral load, 1 month later = undetectable. Still remaining undetectable with current good compliance.</p>
4.		49 M	HIV	<p>Recent admission to hospital after acute MI:</p> <p>Findings:</p> <ul style="list-style-type: none"> <li>- Angiography revealed a thrombotic</li> <li>- 100% occlusion of LMCA and a</li> <li>- 75% stenosis of mid-RCA.</li> </ul> <p>LV-gram demonstrated an akinetic anterolateral wall with moderately reduced LV systolic function and an EF of 35%. Echocardiography demonstrated an EF of 30% and no significant valvular abnormalities.</p> <p>Intra-operative Findings: Heart was free within the pericardium. The aorta had no palpable calcification. Left ventricular function was moderately impaired. The lungs were very hyperinflated and meeting at midline.</p> <p>Quality of Conduit: LIMA and SVG both excellent quality.</p> <p>Quality of Coronary Vessels: LAD was heavily, diffusely diseased. OM1 and PDA were normal at area of grafting, with proximal disease only.</p> <p>Discharge medication:</p> <ul style="list-style-type: none"> <li>- Truvada</li> <li>- Dolutegravir</li> <li>- amiodarone 200 mg daily</li> <li>- aspirin 100 mg daily</li> <li>- Seretide 250/50</li> <li>- metoprolol 100 mg bd</li> <li>- warfarin - INR monitored by GP</li> </ul>

				<p>Wanted to discuss ART and starting statin</p> <p>DDI checked</p> <p>Start Descovy 200/25  - 200/10 was recommended according to Liverpool HIV Drug Interaction Checker, due to TAF levels being elevated by amioderone,  * but compliance has been an issue in the past and current VL still high  * If he was on 200/10 and cardiologist ceased amioderone without our knowing he would be sub-optimally treated  * slight elevation in TAF is still much less than his usual TDF 300mg  * thus commenced on Descovy 200/25 (DTG 50mg continued)</p> <p>Also start rosuvastatin 40 mg nocte</p> <p>Outcomes:  His HIV viral load remains undetectable and his CD4 count is 1100 (46%). His cardiovascular risk factors all remain well controlled and he is not reporting any medication side effects. His renal function remains normal.</p>
5.		68 M	HIV	<p>HIV and ageing:</p> <p>██████████ at age 52</p> <ul style="list-style-type: none"> <li>• First contact with our clinic</li> <li>• Presented with a sexuality/identity crisis</li> <li>• Married - wife and two daughters</li> <li>• Casual male sexual partners - mostly from Southeast Asia</li> <li>• Guilt and risk taking activity</li> <li>• Referred to psychologist - did not attend</li> <li>• STI screen</li> <li>• HIV negative</li> <li>• No other STI' s</li> <li>• Lost to follow up</li> </ul> <ul style="list-style-type: none"> <li>• ██████████ 4 years later, age 56</li> <li>• Presented with HIV seroconversion illness</li> <li>• Diagnosis of HIV confirmed</li> <li>• Recently started a relationship with a 26 year old man from the Philippines</li> </ul>

				<ul style="list-style-type: none"> <li>• In the process of immigration to Australia</li> <li>• Referred to peer support groups</li> <li>• Has earlier been diagnosed with depression and already on an SSRI</li> <li>• July 2007 - commenced ART:</li> <li>• abacavir/lamivudine &amp; efavirenz</li>   <li>• Psycho-Social Factors</li> <li>• Separated from wife</li> <li>• Disowned by all family members - for being “gay” and for his relationship with a younger man</li> <li>• Only acceptance and support from his elderly father</li> <li>• Became socially isolated</li> <li>• Turbulent dealings with Department of Immigration regarding visa for his partner</li> <li>• Worsening depression - still on SSRI</li> <li>• Referred to psychology and developed a good therapeutic relationship</li>   <li>• Memory Issues</li> <li>• [REDACTED] aged 61</li> <li>• Reports poor memory for the first time</li> <li>• Neuropsychological screen [REDACTED]</li> <li>• [REDACTED] presented to hospital after an episode of confusion</li> <li>• Differential diagnosis:</li> <li>• Transient global amnesia</li> <li>• Transient ischaemic attack (TIA)</li> <li>• Mood related</li>   <li>• Psycho-Social impacts</li> <li>• [REDACTED]</li> <li>• Relationship breakdown</li> <li>• Started meeting young men online - all from Southeast Asia. He started to regularly pay for these young men to visit him in Australia</li> <li>• [REDACTED]</li> <li>• Father passed away (Only support person)</li> <li>• Estranged family contesting the will - adding a lot of stress</li>   <li>• Extended hospital stay from May to July 2016</li> </ul>
--	--	--	--	---

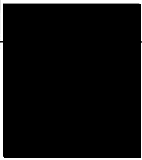

- Admitted with substantial paranoid and persecutory delusions
- DDx of:
  - HIV-associated neurocognitive disease (HAND)
  - Multifactorial brain syndrome
  - Infective
  - Depressive episode
  - Mania
  - Efavirenz
- Working diagnosis
- ? Alzheimer's type / vascular dementia. Possible element of pseudodementia related to longstanding poor mood.
  - HAND less likely on basis of:
    - Not severely impaired immune function at diagnosis (nadir CD4 200)
    - HIV controlled
    - Reasonable CD4 count (560; 46%)
    - Undetectable viral load
- Hospitalisation
- Decreased conditioning with recurrent falls
- Expressed suicidal ideation
- Social isolation as no family, loved ones or visitors
- Adult Guardian agreed for short outings with Queensland Positive People (QPP) and Sexual Health psychologist
  - Complex discharge planning
  - Difficulty in finding a suitable nursing home placement
  - Fear of discrimination due to being a gay man and being HIV positive
  - Involvement of Adult Guardian regarding decision making
  - Trial of home with Transitional Care in July 2016
  - Re-admitted to hospital in September 2016
  - Current situation
    - Still in hospital due to significant discharge challenges
    - Aiming for nursing home placement, at the decision of the Adult Guardian, on the balance of evidence after John failed a trial of home

Reflection:

This case highlights the multiple difficulties faced by the ageing person with HIV.

6.	07/04/20 16	57 M	HIV	<p>1. HIV infection - well controlled on eviplera</p> <p>2. HCV infection - completed sim/sof &amp; riba on 15/03/2016 - SVR12 undetectable</p> <p>3. Osteoporosis - new diagnosis following L4 vertebral compression fracture - seeing his GP regarding this and planning to start on denosumab once dental clearance received and fracture healed</p> <p>Discussed contributory role of tenofovir in osteoporosis Happy to change over to TAF (Genvoya) No DDIs on current meds - perindopril 5 mg daily - spironolactone 100 mg daily - ultibro inhaler</p> <p>Reflection: Tenofovir disoproxil fumarate has been associated with greater decreases in bone mineral density (BMD) and increases in biochemical markers of bone metabolism, compared with comparator agents; suggesting increased bone turnover (Prod Info VIREAD(R) oral tablets, oral powder, 2016). Although one study did not find impaired BMD accrual in HIV-infected children following tenofovir therapy over a 12-month period (Giacomet et al, 2005), other studies have observed absolute decreases in BMD with tenofovir use in children (Gafni et al, 2006; Purdy et al, 2008).</p>
7.	[REDACTED]	65 M	HIV	<p>HIV review Reports no side effects on meds Currently on Triumeq - very strong family history of coronary artery disease - personal history of untreated hypercholesterolaemia and hypertension</p> <p>2. Hypercholesterolaemia - needs to recommence statin</p> <p>CVS calculated risk today 14% ABC increases risk even more</p>

				<p>Past regimens:</p> <ul style="list-style-type: none"> <li>- Combivir/Nevirapine 03/2005</li> <li>- Kivexa/Nevirapine 07/2007</li> <li>- Kivexa/Dolutegravir 04/2015</li> <li>- Triumeq (current)</li> </ul> <p>Virological control since 08/2005  No GRA  With virological control while on AZT/3TC, unlikely to have significant NRTI resistance  Change to Truvada/Dolutegravir today  Normal renal function  No other regular medication at present  Start rosuvastatin 10 mg nocte and ACE inhibitor</p> <p>Weight 78  Pulse: 66  Blood pressure: 148/87 mmHg  Repeat VL in 4 weeks.</p> <p>TREATMENT:  17/06/2016 - Truvada  17/06/2016 - Dolutegravir</p> <p>Outcomes:  His HIV and cardiovascular risk factors all remain well controlled.</p>
8.		56 M	HIV	<p>HIV</p> <ul style="list-style-type: none"> <li>- Well controlled on Triumeq (ABC,3TC,DTG)</li> </ul> <p>Recurrent staph skin infection</p> <ul style="list-style-type: none"> <li>- Has already completed decolonisation regimen</li> <li>- S aureas on nasal swab confirmed</li> </ul> <p>As discussed with and authorised by Infectious Diseases, needs:</p> <ul style="list-style-type: none"> <li>- Rifampicin 300 mg bd x 1 week plus</li> <li>- Flucloxacillin 500mg qid x 1 week</li> </ul> <p>Reflection:  On Triumeq  Rifampicin will decrease dolutegravir plasma levels</p>

				Needs additional 50mg daily of dolutegravir during treatment Will have to repeat decolonisation regimen then Recommence chlorhex or triclosan body wash Above treatment was successful.
9.		59 M	HIV	<p>Patient presented with a letter from his GP, asking whether Genvoya may be causing an increase in his gout flare ups. His concurrent medications included perindopril 10 mg daily and hydrochlorothiazide 25 mg daily.</p> <p>My letter back to his GP: Thank you for your letter regarding XXX' s increased flares of episodes of gout since he was started on Genvoya. Genoya per se has no association with hyperuricemia; it does however contain an ingredient called cobicistat, which is a potent liver enzyme inhibitor (often referred to as a booster). It has therefore a lot of potential drug-drug interactions and in case I suspect that his hydrochlorothiazide levels were boosted by cobicistat, leading to his increased episodes of gout. I have discussed this with him and we have decided to change him to a non-boosted regimen. I am replacing his Genvoya single tablet regimen with a two tablet regimen of Descovy (tenofovir/emtricitabine) and Dolutegravir. Please note that Dolutegravir has the potential to artificially raise creatinine levels by about 5 - 10% from the baseline, which is completely acceptable. I suspect that his gout will settle down on the new regimen, but if not, allopurinol could certainly be started as it does not have any drug-drug interaction with this regimen. Please feel free to contact me should you have any further questions.</p> <p>Since changing his cART, his uric acid levels have returned to normal and he has not had any further episodes of gout. His HIV remains well controlled.</p>
10.		43 M	HIV	<p>Problem list:</p> <ol style="list-style-type: none"> <li>1. HIV infection <ul style="list-style-type: none"> <li>- Diagnosed in 2006</li> <li>- Commenced ART in August 2007 with a CD4 count of 278 (21%)</li> <li>- Changed to Triumeq (dolutegravir/abacavir/lamivudine) in April 2015 from Kivexa (ABC/3TC), Darunavir/ritonavir due to ongoing viral blips and unacceptable elevation in triglycerides.</li> <li>- Sustained undetectable Viral Load since May 2015</li> <li>- CD 4 count on 31/05/2016: 1020 (46%)</li> <li>- Genotype fully sensitive</li> <li>- Normal urine PCR</li> </ul> </li> </ol>

2. Hypertriglyceridemia
  - Grade 3 elevation while on boosted PI (TG = 22.7 mmol/L)
  - Much improved since discontinuing PI and starting statin/fibrate combination, now 2.7 mmol/L
3. Depression/Anxiety
  - Well controlled on citalopram
4. Recurrent, severe genital herpes
5. Syphilis
  - Diagnosed in August 2014 with RPR 1:256
  - Appropriately treated with benzathine penicillin at the time
  - RPR serofast at 1:4

Current treatment:

- Triumeq (dolutegravir/abacavir/lamivudine) 50mg;600;300mg, one tablet daily
- Rosuvastatin 40mg tablets, one at night
- Fenofibrate 145 mg tablets, one daily
- Citalopram 20 mg tablets, one in the mornings
- Valaciclovir 500mg tablets, one daily

References:

1. Grade 2 triglyceride elevations (500 to 750 mg/dL) were reported in 3% of patients who received darunavir 800 mg plus ritonavir 100 mg once daily (n=343) compared with 10% of patients who received lopinavir 800 mg/ritonavir 200 mg per day (n=346) in a randomized, controlled, open-label, phase 3 study of HIV-1-infected, treatment-naive adults. Grade 3 elevations (751 to 1200 mg/dL) were reported in 2% and grade 4 elevations (greater than 1200 mg/dL) were reported in 1% of patients receiving darunavir plus ritonavir compared with 5% and 1%, respectively, in the lopinavir/ritonavir treatment group. Both arms used a fixed background regimen consisting of tenofovir disoproxil fumarate 300 mg/day and emtricitabine 200 mg/day. Total mean treatment exposure was 162.5 and 153.5 weeks, respectively (1).
2. Grade 2 triglyceride elevations (500 to 750 mg/dL) were reported in 10% of patients who received darunavir 600 mg plus ritonavir 100 mg twice daily (n=298) compared with 11% of patients who received lopinavir 400 mg/ritonavir 100 mg twice daily (n=297) in a randomized, controlled, open-label, phase 3 study of HIV-1-infected, treatment-experienced adults. Grade 3 elevations (751 to 1200 mg/dL) were reported in 7% and grade 4 elevations (greater than 1200 mg/dL) were reported in 3% of patients receiving darunavir plus ritonavir compared with 10% and 6%, respectively, in the lopinavir/ritonavir treatment group. Total mean treatment exposure was 80.7 and 76.4 weeks, respectively(1).

				<p>3. In a randomized, controlled phase 2b trial (n=318) assessing the safety and tolerability of therapy, rates of hypertriglyceridemia reported in protease inhibitor-experienced patients who received darunavir 600 mg plus ritonavir 100 mg twice daily (n=65, mean exposure=40.6 weeks) as compared to the control group (n=63, mean exposure=26.3 weeks) were as follows: grade 2 triglyceride abnormality (1.5% vs 20.6%), grade 3 (7.7% vs 4.8%), and grade 4 (3.1% vs 3.2%) (2)</p> <p>References:</p> <ol style="list-style-type: none"> <li>1. 7. LUTS  
- prostatomegaly on USS with volume = 41cc

PMHx:  
- Hypogonadism  
- Osteoarthritis

Meds:  
Perindopril 5 mg daily  
Triumeq  
Sustenon (ceased today due to LUTS)  
Iron supplement

Ex-smoker  
Ex-IDU  
No alcohol use

Absolute CVS risk 9%

Examination:  
BP- 136/86  
HR: 72

I-PSS: 5  
Discussed prostatomegaly

Plan:  
1. Cease testosterone replacement  
2. ? Awaiting new ribavirin - free HCV treatment  
3. Iron infusion.

Review in 1 month to check on effects from ceasing testosterone.

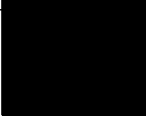

Reflection:

				<p>This patient has co-infection HIV/HCV. He continued to receive 12 weeks of Sofosbuvir/Daclatasvir for the treatment of HCV genotype 3 infection, after the potential drug-drug interactions were checked on the Hep C ichart website of the Liverpool University. His hepatitis C was successfully cured. His HIV remains well controlled. His renal function remains stable and he continues to be followed up by his renal physician.</p>
12.		47 M	HIV	<p>HIV</p> <ul style="list-style-type: none"> <li>- Well controlled on Truvada/Nevirapine(NVP)</li> <li>- Reports no symptoms of side effects</li> </ul> <p>Longstanding elevated liver functions</p> <ul style="list-style-type: none"> <li>- viral hepatitis screen negative</li> <li>- auto-immune hepatitis screen negative</li> <li>- normal iron and heavy metal levels</li> <li>- normal liver ultrasound</li> <li>- ? secondary to NVP</li> </ul> <p>Meds</p> <ul style="list-style-type: none"> <li>-TRU/NVP</li> <li>-Paracetamol/codeine</li> <li>-Amitriptyline 150mg</li> <li>-multi-vitamins</li> </ul> <p>Allergies: Nil</p> <p>Reflection on NVP: Severe and life-threatening hepatotoxicity, including hepatic failure, fulminant and cholestatic hepatitis, and fatal hepatic necrosis, has been reported in patients receiving nevirapine. The first 18 weeks of treatment are a critical period for these events, with the greatest risk occurring in the first 6 weeks, but such events may also occur later. Clinical hepatic events (regardless of severity) occurred in 4% (0% to 11%) of patients receiving nevirapine and 1% of control patients. Hepatic events may or may not occur in association with signs of hypersensitivity. Some patients had nonspecific prodromal signs or symptoms of hepatitis progressing to hepatic failure. Rash occurred in 50% of patients with symptomatic hepatic adverse events. Patients with higher CD4 cell counts may be at higher risk for rash-associated hepatic events. Women appear to be at higher risk for rash-associated nevirapine-related hepatic events (3-fold higher than men), and women with CD4 cell counts greater than 250 cells/mm<sup>3</sup> were reported to be approximately 12 times more likely to experience nevirapine-associated hepatotoxicity (symptomatic with rash) than women with lower CD4 cell counts. Men with CD4 cell counts greater than 400 cells/mm<sup>3</sup> were observed to have an increased risk for rash-associated hepatic events than men with CD4 cell counts less than 400</p>

				<p>cells/mm<sup>3</sup>) (6% vs 1%, respectively) (1.2)</p> <p>Management: This patient was changed over to Truvada/Dolutegravir with excellent virological control and normalisation of LFTs.</p> <p>References: 1. Department of Health and Human Services: Guidelines for the use of antiretroviral agents in HIV-1-infected adults and adolescents. National Institutes of Health. Bethesda, MD, USA. 2004.</p>
13.		25 M	HIV	<p>██████████ a 25 year old heterosexual male from East Timor. He was diagnosed with HIV infection in August 2013. Antiretroviral therapy was commenced in November ██████████ while in East Timor. His initial ART regimen consisted of tenofovir/emtricitabine/efavirenz (TDF/FTC/EFV).</p> <p>He did not engage with our service until February ██████████ at which time his HIV-1 RNA viral load was 875 copies/mL and CD4 count 130 (8%). Compliance with treatment and follow up visits were difficult during the following ten months and he became completely lost to follow up from ██████████</p> <p>In October ██████████ he represented with a dry cough, fever, loss of weight and insomnia. At this stage he was still on his initial ART regimen, but was taking it very infrequently. His HIV-1 RNA viral load was now 457,088 copies/mL and his CD4 count 0 (0%). His genotype resistance assay showed significant NRTI resistance mutations: K65R, V75M, M184I and NNRTI resistance mutations: K103N, Y188H, H221HY. Prior to the results being available he was changed from (TDF/FTC/EFV) to abacavir/lamivudine/dolutegravir (ABC/3TC/DTG). Unfortunately compliance and follow up was again troublesome until December ██████████</p> <p>During late November to early December ██████████ he started to develop paranoid delusions which resulted in hospitalisation. The delusions were thought to be due to HIV encephalopathy. Screenings for opportunistic infections were negative. At admission his HIV-1 RNA viral load was 26,747 copies/mL and his CD4 count 30 (4%). Due to his resistance profile his ART was then changed over from ABC/3TC/DTG to darunavir/ritonavir/etravirine/raltegravir (DRV/r/tv/ETR/RAL). He was also started on cotrimoxazole for PJP prophylaxis, azithromycin for MAC prophylaxis as well as fluconazole and sertraline. He made a good recovery and was discharged after ten days.</p> <p>Since discharge from hospital he is remaining very compliant with his treatment and returns for review regularly. His HIV-1 RNA viral load has become undetectable (&lt; 40copies/mL) since January 2016 and has remained undetectable ever since. His most recent CD4 count was 290</p>

				<p>(13%) on 11 November 2016, with HIV viral load still undetectable.</p> <p>He has however developed a significant hypertriglyceridemia on the combination of DRV/rtv/ETR/RAL and was therefore, as well as for dosing simplification, changed over to Genvoya/Darunavir in September 2016 without any side effects or loss of virological control.</p> <p>His current medications are:</p> <ul style="list-style-type: none"> <li>- Elvitegravir 150mg - Cobicistat 150mg - Emtricitabine 200mg - Tenofovir Alafenamide 10mg (Genvoya). Take 1 tablet in the EVENING with food</li> <li>- Darunavir (Prezista) 800mg Tablets. Take 1 tablet in the EVENING</li> <li>- Sertraline (Setrona) 50mg Tablets. Take 1 tablet in the MORNING</li> </ul>
14.		41 M	HIV	<p>HIV</p> <ul style="list-style-type: none"> <li>- Diagnosed 15 years ago</li> <li>- Started on Kaletra and NVP [REDACTED] 5 years ago, due to mild renal dysfunction thought to be HIVAN per email [REDACTED]</li> <li>- VL undetectable, CD4 330 in February 2015</li> <li>- Complains of many gastrointestinal side effects, predominantly chronic diarrhoea</li> </ul> <p>Seen with his positive partner.</p> <p>No known family history of heart disease  10 pack-year smoker, says quit 5 years ago  no alcohol no drugs  minimal exercise  ?mild hypertension or white coat - check at pharmacy and bring in results  slightly elevated lipids  renal function normal, but has mild proteinuria  no unprescribed drugs  no other sexual partners</p> <p>bloods including lipid profile  discussed STRs  wants no side effects and STR for cost reduction and convenience</p> <p>unfazed by food requirement for Eviplera  compliance good  Partner on Eviplera, advantages and disadvantages of being on same regimen...  Patient's main concern is side effects over the GI side effects of Kaletra  fairly low CV risk (NZ risk 2.5% 5 yrs) but smoking history and slightly overweight</p>

				<p>already UD and ok with food requirement so changed to Eviplera with repeat bloods and urine today and in 4 weeks (Triumeq also reasonable choice given HLA excluded) if any problem with compliance to discuss with us, aware other STR options</p> <p>Reflection on lopinavir: The most common adverse effect associated with antiretroviral regimens containing lopinavir (formulated with ritonavir) is diarrhoea of mild to moderate severity. Pancreatitis has been seen in patients receiving lopinavir, including those who developed marked triglyceride elevations; in some cases fatalities have occurred. Severe, and in some cases fatal hepatotoxicity has also been reported in patients given ritonavir-boosted lopinavir, particularly in the setting of pre-existing chronic liver disease. Other commonly reported adverse effects include asthenia, headache, insomnia, pain, paraesthesia, gastrointestinal disturbances, acne, and rash. Abnormal laboratory test results associated with lopinavir-containing regimens include increases in serum cholesterol and triglycerides and raised liver enzymes. ECG abnormalities such as prolongation of the PR interval, in some cases progressing to second- and third-degree AV block, have occurred in some patients; QT-interval prolongation and torsade de pointes have also been reported.</p>
15		42 M	HIV	<p>HIV - well controlled on Atripla</p> <p>Depression - on citalopram - also well controlled - reports unwanted bad dreams</p> <p>Patient asked questions regarding possibility of changing from Atripla. Has read up on ? Efavirenz role in depression.</p> <p>No other chronic medications HLA B57 excluded No resistance (Feb 2013)</p> <p>Single Tablet Regimen (STR) priority to him.</p> <p>Options discussed 1. Change to Eviplera (most simple change) 2. Change to Tru/Dolu, though STR patient priority. 3. Change over to Triumeq</p>

				<p>The patient decided to change over to Eviplera. He had a repeat HIV viral load done one month after the change-over. His HIV remains well controlled. His depression remains unchanged, but he's happy to report that his bad dreams have stopped.</p> <p>Reflection on EFV:  EFV is known to cause central nervous system side effects, including vivid dreams and morning "hangover" effect. EFV is metabolised hepatically and is contraindicated in mod/severe liver impairment. Food increases EFV levels - take on empty stomach. If daytime symptoms are problematic, take before sleep to minimise side effects during the day. EFV may cause false positive THC test, which should be considered for people who might have to undergo drug testing.</p>
16.		23 M	HIV	<p>. HIV</p> <ul style="list-style-type: none"> <li>- diagnosed May 2014</li> <li>- initial emotional upset causing him to return [REDACTED]</li> <li>- had difficulty accepting diagnosis and couldn't face [REDACTED] friends</li> <li>- had good family support [REDACTED] and has disclosed diagnosis to his sister</li> <li>- feels ready to start treatment now</li> <li>- gets regular, bad dreams</li> <li>- investigations at time of diagnosis: <ul style="list-style-type: none"> <li>* VL 209 430</li> <li>* CD4 740 (31%)</li> </ul> </li> </ul> <p>2. Rheumatic heart disease</p> <p>3. Asthma</p> <p>Meds:  Fluticazone  Salbutamol</p> <p>Allergies: Nil</p> <p>Lengthy discussion regarding diagnosis, treatment as well as possible side effects  Investigations requested.  Referral to peer support group.  Review in 1 week to start treatment.</p> <p>On [REDACTED]  Presented today to start treatment  Feeling well  Keen to start and fully counselled</p>

				<p>Also due to have penicillin injection for rheumatic heart disease</p> <p>HLAB57 not done before - requested today          Bloods from 05/02/2015:          VL 408,710          CD4: 370 (33%)          TB Quantiferon Negative          Normal renal and liver functions</p> <p>Plan:          1. Start truvada &amp; dolutegravir          2. Review in 4 weeks          3. benzathine penicillin 900mg im given, left glute</p> <p>This patient requires a lot of support from doctors, nurses and health workers from our clinic in terms of following up appointments, transport to and from the clinic, as well as regular dose reminders. He receives his medications in a doset box and has since been changed over to Genvoya for easier dosing. His HIV remains well controlled.</p>
17.		51 M	HIV	<p>HIV          - Diagnosed 2014</p> <p>Married; lives with wife, but casual MSM. Very anxious / depressed recently and having some self-destructive and risky sexual behaviours.</p> <p>Commenced on SSRI 2 weeks ago with minimal impact so far.          Has had some suicidal thoughts.</p> <p>Identifies his family as protective factors.</p> <p>Given number for acute care team and will ask our psychologist to touch base with him.</p> <p>Also discussed URAI;</p> <p>1) Risk of other STIs          2) (Low) risk of transmission of HIV          3) In contravention of Public Health act disclosure requirements</p> <p>Not currently sexually active with his wife.</p>

				<p>Advised:  1) disclosure  2) condoms</p> <p>Plan:  - See again in a couple of weeks to consider up-titrating/changing SSRI  - STI screen today</p> <p>Reflection:  This case highlighted some of the psychosocial difficulties that many PLWHIV and the MSM community still face.  His depression is currently well controlled and he is still receiving medical and psychological support from our clinic.</p>
18.		66 M	HIV	<p>. HIV  - on Eviplera at present  - VL &lt;40  - CD4 540 (28%)</p> <p>2. Renal dysfunction  - creat 127, urea 5.6, eGFR 50, CrCL = 49 mL/min  - u-ACR 12, u-PCR 74  - compared to results from July [REDACTED] very similar  - has not been on dolutegravir since March (changed over to eviplera then), so unlikely artifactual raise in creatinine  - cannot recall any renal imaging  - denies LUTS, though does have some post void dribbling  - UC&amp;E repeated today, if CrCL still &lt; 50 mL/min - would need dose adjustment of tenofovir</p> <p>Plan:  1. Bloods repeated today  2. Referred for USS KUB/Prostate  3. Renal dysfunction possibly due to TDF.  4. Review in 1 week</p> <p>At review his renal function remained unchanged. His HIV remained well controlled. Ultrasound imaging showed no pathology. He was consequently changed over to Genvoya, which at that stage was the only available TAF containing regimen.</p> <p>On [REDACTED]  1. HIV</p>

				<ul style="list-style-type: none"> <li>- very well controlled on Genvoya</li> <li>- VL undetectable</li> <li>- CD4: 520 (31%)</li> <li>- eGFR 70 (up from 47)</li> <li>- u-PCR &lt;29 (down from 73)</li> <li>- no side effects on Genvoya and happy to continue</li> </ul> <p>2. Hypercholesterolaemia</p> <ul style="list-style-type: none"> <li>- t-Chol 7.0</li> </ul> <p>Pulse: 61  Blood pressure: 115/70  Absolute CVS risk &gt;15%  Recalculated using target t-Chol of 4.0 = 5%</p> <p>Long discussion regarding getting cholesterol down  Demonstrated 10% reduction in heart attack and stroke risk  Absolutely against use of statin and says he will NEVER use a statin  Tried to explain importance - not interested  Discussed Smoking, Nutrition, Alcohol and Physical activity.  HIV R/V 3 months  Sooner if any problem</p>
19.		70 M	HIV	<p>HIV</p> <ul style="list-style-type: none"> <li>- Diagnosed 9 months ago.</li> <li>- On Stribild</li> </ul> <p>Meds:</p> <ul style="list-style-type: none"> <li>- Stribild</li> <li>- Vit B12</li> <li>- Aspirin 100mg Tablets</li> <li>- Clopidogrel 75mg Tablets</li> <li>- Metoprolol 50mg Tablets 1/2 tab PO BD</li> <li>- Perindopril 2.5 mg 1 tab PO mane</li> <li>- Prochlorperazine 5mg</li> <li>- Simvastatin 80mg Tablets</li> </ul> <p>Increasing viral load past 6 months</p> <p>Patient denies any missed tablets on repeat questioning - reports 1-2 tablets missed in last month only.</p>

				<p>Discordant partner - advised regarding increased risk of transmission due to increased viral load. Partner reports suspicion that patient not taking his meds regularly. Integrase resistance very rare - poor compliance most likely</p> <p>Plan</p> <ul style="list-style-type: none"> <li>- continue Stribild</li> <li>- discussed methods of improving compliance.</li> <li>- repeat VL and CD4</li> <li>- GRA - including integrase inhibitors</li> <li>- Review in 2 weeks.</li> </ul> <p>Outcome:</p> <p>GRA showed no integrase inhibitor resistance. Compliance now good with the use of a doset box. No further viral blips. Polypharmacy thought to be the cause of difficult compliance.</p>
20		53 M	HIV	<p>Acute watery diarrhoea ~ 1/52.</p> <p>Fever, watery diarrhoea, no blood No recent travel No unwell contacts. No suspect foods.</p> <p>Asking if it could be related to Stribild - been on it for about a year.</p> <p>Imp:</p> <ul style="list-style-type: none"> <li>- sounds infective</li> </ul> <p>Plan:</p> <ul style="list-style-type: none"> <li>- long chat reassuring about Stribild.</li> <li>- Also quite a few questions about TasP (read an article in Time Magazine)</li> <li>- discussed risks of transmission</li> <li>- importance of safe sex for other STIs</li> <li>- discussion about serosorting</li> <li>- Reiterated current legal requirement to disclose status if unprotected, but importance of informed consent with partners.</li> <li>- Stool samples for: Entamoeba histolytica PCR, Giardia intestinalis PCR, Cryptosporidium species PCR, Rotavirus PCR, Norovirus PCR, Adenovirus 40/41, Adenovirus PCR, Vibrio parahaemolyticus PCR, Vibrio</li> </ul>

				<p>cholerae PCR, Yersinia enterocolitica PCR, Campylobacter species PCR, Shigella species PCR, Salmonella species PCR and C.difficile Toxin.</p> <p>Returned reactive result for Shigella spp. Treated with oral azithromycin for 7 days. Not a food handler. Diarrhoea resolved.</p>
21.		18 F	HIV	<p>18 year old lady with a respiratory illness on a background of poorly controlled HIV</p> <ul style="list-style-type: none"> <li>- Presented 3/5 with a 2-3 week history of increasing SOB</li> <li>- Cough productive of white sputum; fevers and headache</li> <li>- Medicare inelligible so does not want to go to hospital (is still paying off her bill from last time)</li> <li>- Started on empiric Bactrim DS 2xtab tds for presumed PJP</li> <li>- Has not taken her Atripla for 8/12; couldn't afford it according to px</li> <li>- No diarrhoea</li> <li>- Did not have a CXR as couldn't afford it</li> <li>- Started on triumeq 2/7 ago</li> <li>- CD4: 130 (14%)</li> <li>- HIV VL pending</li> <li>- No neutrophilia</li> </ul> <p>Currently:</p> <ul style="list-style-type: none"> <li>- States she is no longer having fevers and headache has resolved</li> <li>- Ongoing SOB; has to pause when walking up a flight of stairs</li> <li>- tolerating the high dose Bactrim</li> <li>- No rash</li> <li>- Was very anxious when discussing that her CD4 count was low and her HIV VL high</li> </ul> <p>O/E:</p> <p>Obviously SOB  RR: 25-30; sats: 93% RA  PR: 95 BP: 105/75  No thrush  Chest: Scattered fine creps and occasional wheeze  HS dual nil added  No peripheral oedema  No neck stiffness</p> <p>Impression:  Likely PJP in a px with a CD4 count of 130. Severe as sats: 93% but due to complex social issues does not want to come to hospital</p> <p>Plan (in consultation with ID):  1. Start prednisolone (as per eTG)</p>

				<p>2. Continue Bactrim 2x tabs tds for 3/52</p> <p>3. Continue triumeq (we have managed to get this on compassionate access)</p> <p>4. To present to hospital if she worsens; if she improves we will RV her next week (will do bloods then to check UEC/ FBC on the bactrim)</p> <p>5. Urinary strep pneumo and legionella antigen to help exclude another aetiology for her pneumonia</p>
22.		48 F	HIV	<p>1. HIV infection</p> <ul style="list-style-type: none"> <li>- diagnosed in 2010</li> <li>- Late presentation with viral load: 591,450, CD4: 80 at diagnosis</li> <li>- Heterosexual, single female.</li> <li>- Commenced on Truvada, Darunavir, ritonavir with good virological control and return of CD4 to mid 500' s</li> </ul> <p>2. Plasmablastic large cell lymphoma</p> <ul style="list-style-type: none"> <li>- Diagnosed August 2015.</li> <li>- HSV I + II, CMV + EBV - positive</li> <li>- Commenced EPOCH (etoposide, prednisolone, oncovin [vincristine], cyclophosphamide and hydroxydaunorubicin [doxorubicin/adriamycin])</li> <li>- Potential drug-drug interactions with darunavir and EPOCH, as well as ritonavir and EPOCH as per University of Liverpool database.</li> <li>- Changed over to Truvada/Dolutegravir with no loss of virological control during chemotherapy.</li> </ul> <p>Reflection:</p> <p>1. The risk of developing NHL is dramatically increased in people with HIV infection, with a 134-fold increased incidence above that seen in the general population. Since the widespread use of cART, the prognosis of HIV-NHL has improved with better tolerance of chemotherapy and better response rates. Both the rate of complete remission and the duration of complete remission have increased. Plasmablastic lymphoma has a strong association with Epstein Barr virus, distinguishing it from plasmacytomas, with which it is frequently histologically confused.</p> <p>2. It is important to consider potential drug-drug interactions when prescribing any other medications concurrently with cART.</p> <p>3. Good communication within the multidisciplinary team, in this case haematology, is very important.</p>
23.		35 M	HIV	<p>New diagnosis HIV. <span style="background-color: black; color: black;">[REDACTED]</span> by GP</p> <p>Diagnosis made on <span style="background-color: black; color: black;">[REDACTED]</span> by GP</p> <p>STI screen done there - NAD</p> <p>No chronic medical conditions</p> <p>No medications</p>

				<p>Allergic to penicillin</p> <p>MSM  Negative HIV screening test 6 years ago [REDACTED]  Had Dengue-like illness in [REDACTED] with no serological evidence of dengue at the time - ? time of seroconversion illness.</p> <p>Currently in relationship - partner tested negative on Friday  Few partners outside of relationship  Denies unprotected anal sex. Has not had any sex with partner for many years  No IDU  Tattoo in Thailand [REDACTED]</p> <p>Weight 85  BMI: 27.4  Blood pressure: 158/99 mmHg Sitting  Chest clear  Abdo normal  No neurological signs</p> <p>Lengthy discussion regarding diagnosis and treatment  Keen to start straight away  Options discussed - wants to start on Stribild  Baseline blood all done today.  Discussed legal requirements  Written information provided</p> <p>For repeat renal function tests in 1 month</p> <p>Psychology referral</p>
24.	[REDACTED]	62 M	HIV	<p>Scheduled RV</p> <p>PMHx:  1. HIV  -Dx 2014 via screening (wife had just been Dx antenatally)  -Started on Stribild with good response  -last CD4: 580 (58%) and HIV VL: &lt;40 (Nov 2014)  -No resistance  -HLA-B57 negative</p>

				<p>2. Hypercholestromia -Dx recently by GP; started on rosuvastatin</p> <p>3. Impaired glucose tolerance -GP apparently just checked this and the Px states he "does not have diabetes"</p> <p>4. Hypertension -Controlled on anti-hypertensives</p> <p>5. deranged LFTs thought sec. to fatty liver -Liver USS has been done by his GP according to Px</p> <p>6. Obesity (non-smoker)</p> <p>Currently: Px feels well No issues with tablets Good compliance GP recently ceased amiloride (which is on for hypoaldosteronism) due to low K; Px states this tablet made him put on weight</p> <p>Meds: Moxonidine 400mcg am; 200mcg pm Olmesartan/ HCT 40/12.5 Allopurinol 300mg D rosuvastatin 5mg D (I looked up for interactions; none recorded)</p> <p>Impression: Px stable Newly Dx hypercholestromia with rosuvastin started by GP</p> <p>Plan: 1. HIV VL/ CD4/ Hep A/B/C; 2. urine alb:Cr ratio 3. Discussed weight management issues 4. Script for Stribild 5. RV 3/12</p>
25.		40 M	HIV	<p>Problem list: HIV infection</p>

- diagnosed in [REDACTED] acquisition likely in 2010
- presented with:
  - i. Pneumocystis jirovecii pneumonia
  - ii. CD4 count 160 (7%)
- Viral load 282,676
- Heterosexual, married man. Wife HIV negative.

IgA nephropathy

- Diagnosed [REDACTED]
- Proteinuria around 1000mg/24hr based on random urines. PCR sitting around 70.
- Initially on Truvada / Dolutegravir, changed to Triumeq as precaution based on proteinuria.
- Started ACE-inhibitor, renal risk factors addressed. Improved renal function and decreased proteinuria.

Reflection:

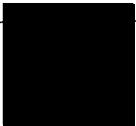

1. Pneumocystis jirovecii (previously Pneumocystis carinii) is a fungus that is ubiquitous. It is unclear whether infection occurs as a primary event or as a result of colonisation with reactivation, although antibodies against the organism are present in more than 85% of children under 3 years of age, suggesting that reactivation with immunosuppression occurs. P. jirovecii pneumonia (PJP), is still the most common AIDS defining condition, and is usually seen in people presenting late in the course of HIV infection or in people with poor adherence to PJP prophylaxis or combination antiretroviral therapy (cART). PJP occurs uncommonly in persons with a CD4 T-lymphocyte (CD4) cell count > 200 cells/μL, or proportion of CD4 cells that is > 14% of total lymphocytes, although cases have occasionally been reported in people with more preserved immune function. Secondary prophylaxis after an episode of PJP is recommended to prevent relapse or recurrence until immune reconstitution has occurred.

Discontinuing prophylaxis

Cohort studies have demonstrated the safety of discontinuing both primary and secondary PJP prophylaxis after the CD4 cell count has risen above 200 cells/μL or the proportion of CD4 cells is > 14% of total lymphocytes for longer than 3 months, in the setting of viral suppression with cART. More recent data suggest that the risk of PJP is as low with even earlier discontinuation of prophylaxis when the CD4 cell count is > 100 cells/μL, in the setting of viral suppression.

2. Tenofovir disoproxil fumarate (TDF) may cause renal impairment, proximal renal tubulopathy, Fanconi syndrome and renal failure. In light of his IgA nephropathy, I decided to change him over onto a different backbone combination and chose Triumeq as a Single Tablet Regimen (STR) for dosing convenience. His HIV remains well controlled.

3. Recent data from interim analyses of two cohort studies presented at CROI in 2014 and 2015 reported no transmissions in serodiscordant homosexual male couples with undetectable viral load. This included data from the European PARTNER study (Rodger, 2014) which reported no HIV transmissions in 308 couple years of follow-up when condomless anal intercourse was

			<p>reported, and the HIV positive partner had undetectable viral load (Rodger, 2014), and data from the Australian-Thai-Brazilian Opposites Attract study, which reported no transmissions when condomless anal intercourse was reported in 89 person years of follow up in couples with viral load less than 200 copies/mL (Grulich, 2015). Data from these two studies strongly suggest that anti-retroviral therapy greatly reduces HIV transmission in serodiscordant homosexual couples. However, a very low rate of transmission cannot be ruled out. Follow up continues in both studies and final study results are expected in 2016-17. The couple used TAsP successfully and his wife remains HIV negative.</p>
26.		34 M	<p>. Advanced HIV  - CD4 40 on admission  - on stibild now  - CD4 70 ~2W ago</p> <p>2. 32.	██████	51 M	HIV	<p>GP referral for newly diagnosed HIV/HCV co-infection</p> <p>51 yo MSM</p> <ul style="list-style-type: none"> <li>- in 8 year relationship with his 44 year old male partner</li> <li>- no sexual intercourse of any kind with partner &gt; 1 year ago partly due to partner's erectile dysfunction</li> <li>- Partner aware of new HIV diagnosis and is currently very supportive</li> <li>- not in open relationship, but had threesome together with another unknown guy who they met in a bar about 4 years ago. Had unprotected RAI, IAI and oral sex</li> </ul> <p>- 8 weeks ago had a threesome with another couple that he met on Grinder. This is not known to</p>

partner. The couple recently relocated [REDACTED] Name of one known, can't recall the name of the second [REDACTED] at present. Has deleted them off Grindr, but knows where they live.

- Unprotected RAI, IAI and oral sex with both of them
- one had a Prince Albert and told him at the time the piercing got infected
- was contacted by the couple about 2 weeks after who then informed him of a pos gonorrhoea result
- Has seen his GP straight after being informed, who unfortunately did not request any investigations or offer treatment.
- denies having any SI with partner since the threesome

No clear history of seroconversion like illness

- has started complaining of a headache 5 weeks ago (3 weeks after threesome), headache is persistent and his GP in Port Douglas has prescribed Valium for this with not much effect
- denies photophobia, nausea or neck stiffness
- has lost 5kg of weight over the past 4 weeks.
- oral thrush symptoms for the past 5 weeks.
- has noticed swollen neck glands from the same time as thrush symptoms
- no cough or dyspnoea
- no skin rashes

New Hep C diagnosis

- cannot recall ever being told of elevated LFTs
- denies IDU
- tattoo left scapular area [REDACTED] 20 years ago

PMH:

Melanoma, left heel

- initially excised in [REDACTED] but recurred
- re-excised in [REDACTED]

Current meds

Valium 5 mg prn (for headaches??)

Alcohol: daily, up 10 beers a day

Smoking: 10 - 20 per day since age 18

On Examination

Height: 178.5

Weight 57

				<p>BMI: 17.8  Pulse: 87  Blood pressure: 96/68 mmHg  Temperature: 37  O2 sats 96%  Generalised lymphadenopathy  Oral thrush  No focal neurological signs. no neck stiffness  Chest clear  Enlarged liver with smooth edge, spleen not palpable  No skin rashes</p> <p>Diagnosis:  1. HIV/HCV co-infection  - well aware of legal requirements and risk of transmission  - will contact couple as mentioned above  - not keen on engaging with any support organisation at present  - will cut back on alcohol use</p> <p>2. Oral candidiasis</p> <p>Plan:  Routine HIV and HCV initial bloods workup  Full STI screen  CXR  USS liver/spleen</p> <p>TREATMENT:  26/11/2015 - fluconazole</p> <p>Will return in 10 days to start treatment  Happy to be contacted by phone if any more urgent results/review required  Will return sooner if needed.</p>
33.		18 M	HIV	<p>18 year old Indigenous MSM referred from GP with newly diagnosed HIV  Recent hospital admission with left inguinal abscess that required I&amp;D  Follow up tests done with GP included HIV test --&gt; pos</p> <p>~10 male sexual partners over the past year  - versatile, mostly condomless</p>

- 2 of them known to him
- last SI ~ 1 month ago
- denies any seroconversion symptoms
- has generalised, non-specific pigmented skin rash
- denies any STI symptoms

Cannot recall last neg HIV test  
 Never been diagnosed with STI before

VITAL SIGNS:

[REDACTED]  
 Height 177  
 Weight 66  
 BMI: 21.1  
 Pulse: 71  
 Blood pressure: 118/70 mmHg  
 ENT normal  
 Chest clear  
 Abdo normal

Bloods and full STI screen done

Aware of pos diagnosis  
 Aware of services and support available  
 Aware of legal responsibilities regarding safe sex

Treatment discussed and keen to start on treatment today.

TREATMENT:

[REDACTED] - Stribild

To look out for IRIS  
 Review in 10 days

				<p>- 2 of them known to him</p> <p>- last SI ~ 1 month ago</p> <p>- denies any seroconversion symptoms</p> <p>- has generalised, non-specific pigmented skin rash</p> <p>- denies any STI symptoms</p> <p>Cannot recall last neg HIV test          Never been diagnosed with STI before</p> <p>VITAL SIGNS:</p> <p>[REDACTED]          Height 177          Weight 66          BMI: 21.1          Pulse: 71          Blood pressure: 118/70 mmHg          ENT normal          Chest clear          Abdo normal</p> <p>Bloods and full STI screen done</p> <p>Aware of pos diagnosis          Aware of services and support available          Aware of legal responsibilities regarding safe sex</p> <p>Treatment discussed and keen to start on treatment today.</p> <p>TREATMENT:</p> <p>[REDACTED] - Stribild</p> <p>To look out for IRIS          Review in 10 days</p>

40.	[REDACTED]	63 M	HIV	<p>Problem list:</p> <ol style="list-style-type: none"> <li>HIV infection <ul style="list-style-type: none"> <li>On Truvada, Atazanavir/ritonavir</li> <li>CD 4: 260 (12%)</li> <li>Viral load &lt; 20</li> </ul> </li> <li>Hyperbilirubinaemia</li> <li>Hypercholesterolaemia</li> </ol> <p>Current treatment:</p> <ul style="list-style-type: none"> <li>Truvada 300mg;200mg, one tablet daily</li> <li>Atazanavir 300 mg, one tablet daily, boosted with Ritonavir 100mg daily</li> </ul> <p>Reflection: Atazanavir could be contributing to his increased total bilirubin and hypercholesterolemia. His renal function is normal. Calculated absolute cardiovascular risk put him at increased risk and therefore I did not recommend an Abacavir containing regimen. I recommended to keep him on Truvada 300;200mg daily and to change him from Atazanavir/ritonavir to Dolutegravir 50 mg daily. His bilirubin levels returned to normal and his HIV remains virologically suppressed.</p>
41.	[REDACTED]	45 M	HIV	<p>45 year old male Relocated [REDACTED] 10 days ago</p> <ol style="list-style-type: none"> <li>HIV <ul style="list-style-type: none"> <li>- Dx ~ 1992</li> </ul> </li> </ol>

- started on treatment ~ years 5 ago
- nadir CD4: 220
- well controlled at present

2. Valvular heart disease

3. Renal failure

- 2 years ago
- auto-immune - Cryoglobulinaemia
- was close to dialysis
- renal function since normalised

4. Depression

5. Hypertension

- has been told in the past that he has high blood pressure, but was never keen to start treatment

Came out of 9 year relationship 18 months ago

4 casual partners since

Last STI screen just prior to leaving [REDACTED]

Declined STI screen today, no sexual partners since last test

PMH: Endocarditis, uncertain cause

PSH: Appendectomy age 20

Meds:

- Atripla, no side effects
- Escitalopram 20 mg

Drugs: none

Alcohol: occasional

Smoke: ex-smoker (stopped 2010); 1 pack a week

Pulse: 64

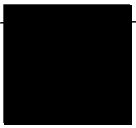

Blood pressure: 145/105 mmHg

HIV routine bloods done plus u-PCR

Last bloods March [REDACTED]

Has enough meds for another 1.5 months

				<p>Management:</p> <ol style="list-style-type: none"> <li>1. Start Ramipril 10 mg daily - needs to return in about 5 days for repeat renal function after commencing ACE</li> <li>2. Suggested changing off from Atripla for 2 reasons: depression and history of renal disease. Recommended Genvoya - quite keen on this and will make the change over when running out of Atripla</li> <li>3. Review again in 10 days from today to discuss results and check on BP</li> </ol>

- CD4: 220 (15%)
- HIV Viral Load 544,269

2. Hypertension
- Has been prescribed an ACE-inh in the past, but non-compliant

3. T2DM
- HbA1C 7.3
  - u-ACR 32
  - eGFR73
  - not taking any hypoglycaemic agents

4. Hypercholesterolaemia
- not to target

Current treatment:

- Genvoya (elvitegravir 150 mg, cobicistat 150 mg, emtricitabine 200 mg, tenofovir alafenamide fumarate 10 mg), one tablet daily

Thank you for referring XXX to our clinic after his recent diagnosis of HIV infection. I have caught up with him again today after his initial visit to our clinic on [REDACTED]. He is still understandably quite shocked after being informed of his diagnosis, but has engaged with our psychologist and is currently doing well under the circumstances. XXX reports no HIV-associated symptoms and his clinical examination was unremarkable. During his initial visit he was hypertensive with a blood pressure of 157/84, on repeat today his blood pressure was 137/82 mmHg. He weighs 88kg and is 175cm tall. He told me today that he has a follow up appointment booked with yourself for tomorrow and that he will discuss the management of his cardiovascular risk factors with you. He will be starting his antiretroviral therapy today and I have warned him to be on the lookout for symptoms of Immune Reconstitution Inflammatory Syndrome (IRIS) in which case he will contact us immediately. With a CD4 count of 220 he does not require any prophylactic treatment for opportunistic infections at present. He is starting a single tablet (four agent) regimen, called Genvoya. Two of the ingredients, (elvitegravir and cobicistat) has potential drug-drug interactions with metformin, increasing the plasma concentration of metformin. We still advise metformin as first line therapy for his diabetes (in conjunction with the normal lifestyle modifications), but close monitoring is recommended. Rosuvastatin would be a safe choice of lipid lowering agent and ACE-inhibitors has no potential side effects. I have asked [REDACTED] to return to our clinic in a week or two to review for any signs or symptoms of IRIS. He will have another follow up visit with us in 4 weeks to repeat his HIV viral load and CD4

				<p>count. He knows that he can contact us at any time if needed. Please do not hesitate to contact us if you have any questions. Thank you for managing his CVS risk factors.</p>
44		56 M	HIV	<p>56 year old retired truck driver referred from GP with new diagnosis of HIV - incidental finding on memory clinic screening tests</p> <p>1. HIV - new diagnosis - CD4: 40 (3%), VL 704,165 - no resistance mutations - HLA B57 excluded - informed by GP - exclusively heterosexual - up until 12 months ago had been sexually active with 3 different Thai women over a period of 4 years - denies unprotected sex with any of these girls - contracted gonorrhoea [REDACTED] while in Thailand - denies any seroconversion symptoms - no dyspnoea, headache, visual changes or lymphadenopathy - had been in 9 year monogamous heterosexual relationship prior to this - currently been with same female partner in monogamous relationship for the past 12 months - has unprotected intercourse (had vasectomy) - also has UPAI with her - denies IDU, tattoos, steroid injections, blood transfusions</p> <p>2. Chronic diarrhoea since Jan this year - current Aeromonas species on MCS - one documented Campilobacter in Feb 2016 - recent repeat faecal MCS done by GP clear - diarrhoea ongoing - no loss of weight - no fevers</p> <p>3. Significant seborroic dermatitis - given a lot of different antibiotics for this by GP (?)</p> <p>4. Probable eosinophilic folliculitis - on clinical appearance today</p>

5. Past CVA

- was told it affected a "central area" of his brain affecting his short term memory
- has not been seen by memory clinic since then but re-engaged with local team 1 month ago.
- says symptoms presented as meningitis

6. Cervicogenic headaches

7. Has been told in the past that he has hypercholesterolaemia, but says it's diet controlled

8. Was previously on antihypertensives but discontinued

9. Large soft tissue tumour removed from right upper thigh 18 months ago (unsure of specific diagnosis)

- Being followed up by oncology
- does have a lot of widespread lipomas (probably not related to above tumour though)

Ex-smoker: 20/day for 20 years, quit 6 years ago

Very rarely uses alcohol

Denies drug use

Current meds:

- Sertraline 100mg daily
- Ibuprofen 400 mg prn

Allergies: Nil

PMHx:

- meningitis at age 15

PSHx:

- vasectomy

Relocated to our area in [REDACTED]

Currently on disability pension due to multiple MSK problems

Weight 105

BMI: 36.3

Pulse: 74

Blood pressure: 144/87 mmHg

				<p>No lymphadenopathy  Significant facial, peri-ocular and peri-aural seborroic keratosis  Severe intertrigeal tinea  Clinically widespread eosinophilic folliculitis  Chest clear  No meningism</p> <p>Lengthy discussion with both him and his partner  Very keen to start treatment as soon as possible  Genvoya prescribed  Warned to look out for IRIS  Clinical review within a week or two, sooner if any problems</p> <p>Management and reflexion:  His CXR showed no radiological evidence of an infective process. Lung fields are overinflated, in keeping with COPD.  He was commenced on Genvoya for cART after potential drug-drug interactions were checked. Bactrim prophylaxis for PJP and Azithromycin prophylaxis for MAC was commenced. Biopsy of his skin lesions confirmed the diagnosis of eosinophilic folliculitis. He had no side effects on treatment and had an undetectable viral load within 8 weeks after commencing cART. This resulted in resolution of his chronic diarrhoea, eosinophilic folliculitis and tinea. His primary prophylaxis was ceased after his CD4 count was &gt;100 for 3 months, along with an undetectable VL. Recent data suggest that the risk of PJP is low with early discontinuation of prophylaxis when the CD4 cell count is &gt; 100 cells/ <math>\mu</math> L, in the setting of viral suppression. Primary prophylaxis against MAC infection may be ceased with cART-associated immune reconstitution when the CD4 cell count is &gt; 100 cells/ <math>\mu</math> L for 3 months in the setting of adequate viral suppression.  He has since been diagnosed with arthritis by his GP, who also commenced oral prednisolone. Due to significant drug-drug interactions of prednisolone and cobicistat, he was promptly changed over to Descovy plus Dolutegravir without any side effect. He remains virologically suppressed and is doing well with a CD4 of 220 (13%).</p>
45.		49 M	HIV	<p>49 year old female accompanying her male partner of 12 months who has recently been diagnosed with HIV infection</p> <p>1. HIV  - new diagnosis, confirmed  - asymptomatic  - cannot recall any seroconversion symptoms  - had Ross River Virus in 2013, and "flare up of symptoms" around 12 months ago ?  seroconversion</p>

- has been married for 27 years - husband passed away (? cause)
- had platonic boyfriend for a few years when she moved to this area (man had ED, so they were not sexually active). He also passed away (says she heard afterwards that his ED was from steroid injections)
- current partner for 12 months

Otherwise in good health

Not on any contraception

- partner had vasectomy
- peri-menopausal
- no hot flushes

Normal pap smear and mammogram within this year.

Relocated to our area 3.4 years ago

Smoker: 20/day since age 14

Very rarely uses alcohol

Denies drug use

Current meds:

- Ibuprofen 400 mg prn

Past surgery: cholecystectomy 

Allergies: Penicillin - rash

Weight 74

BMI: 28.2

Pulse: 73

Blood pressure: 143/97 mmHg

No lymphadenopathy

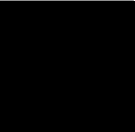

No skin rashes

Chest clear

No meningism

Lengthy discussion with both her and her partner

Very keen to start treatment today

				<p>Genvoya prescribed  Warned to look out for IRIS  Clinical review within a week or two, sooner if any problems</p> <p>Reflection:  This husband and wife couple was diagnosed with HIV infection. Her husband perceived his risk of HIV infection as low and never disclosed his sexual contacts in Thailand to his GP. This led to the delay in diagnosing his infection and as such, also to his partner being infected. Her infection could potentially have been prevented, had his diagnosis been made early and he commenced on cART for treatment as prevention (TAsP). HPTN 052 showed that early treatment - started at a CD4 count between 350 and 550 cells/mm<sup>3</sup> - reduced the risk of HIV transmission to an uninfected partner - by at least 96%. Almost all the study participants were heterosexual couples.</p>
46.		53 M	HIV	<p>. New diagnosis HIV  - referred by GP - reactive WB.  - MSM  - UPRAI in Bali in first week of   - has not had any other risky exposures</p> <p>Seroconversion ~24/09/2016  - presented to GP with fevers, ILI symptoms  - ongoing arthralgia and hyperaesthesia at present</p> <p>Last non-reactive HIV test in March 2016 (with GP)</p> <p>PMH:  1. Coeliac disease  - 1996</p> <p>2. Vit B12 deficiency  - secondary to coeliac</p> <p>3. Osteopaenia  - secondary to coeliac</p> <p>4. Childhood epilepsy  - never had any seizures as adolescent or adult</p> <p>Meds:  B12 injections</p>

				<p>Citracal + D</p> <p>Allergies: None</p> <p>Diagnosis discussed Keen to start treatment today DDIs with Genvoya checked - none identified</p> <p>Education and support offered Referral to support organisations/psychology - declined Not distressed by diagnosis</p> <p>Legal responsibilities discussed, including condom use and undetectable VL.</p> <p>Review in 4 weeks Warned on IRIS</p> <p>Reflection: This case demonstrated dealing with the initial diagnosis of HIV and the treatment planning involved.</p>
47		31 M	HIV	<p>HIV</p> <ul style="list-style-type: none"> <li>- initial diagnosis in Feb [REDACTED]</li> <li>- contact tracing suggests infection in [REDACTED] during street fight</li> </ul> <p>ART history:</p> <ul style="list-style-type: none"> <li>- March 2013: started Atripla - discontinued due to psych SEs and changed over to Tru/Ral straight away.</li> <li>- April 2013 - Dec 2014: Tru/Ral - discontinued due to falling out with ART provider. Was unprepared to have 3-monthly bloods taken.</li> <li>- March 2015: recommenced treatment with Triumeq - discontinued after 1 month due to similar side effects as when he was on Atripla.</li> <li>- no ART at all since then</li> </ul> <p>Reports bloods done 3 months ago with (verbally provided by him) results: CD4: 290 (28%), concurrent URTI at the time VL: 43000</p> <p>States that he has not been sexually active at all since discontinued treatment in Dec 2014</p>

				<p>Heterosexual Met new female partner (no sex yet). Wants to recommence prior to becoming sexually active again - been with current partner for the past month - partner aware of diagnosis</p> <p>No chronic medical conditions No daily meds No allergies No OTC meds</p> <p>Previous GRA (20/05/2015): - L10FIL, K20I mutations - Low-level resistance to nelfinavir - completely susceptible to NRTIs and NNRTIs</p> <p>Plan: Restart Genvoya Aware that he needs to have bloods repeated in 1 month Aware of transmission risk if not undetectable</p> <p>Lives in [REDACTED] and aware of availability at community pharmacy - not keen on this at the moment. RV 1 month Discussed at length what routine monitoring will involve.</p> <p>Reflection: This case highlighted some of the difficulties in keeping PLWHIV engaged with services. This is a heterosexual man, who was carrying a lot of anger related to being diagnosed with an infection that he felt, only affects MSM. He had disengaged from two other Sexual Health Clinics in the state after he felt unfairly treated by these services. In addition to the above difficulties, he now also lives in a regional area where access to specialised HIV services is difficult.</p>
48.	[REDACTED]	33 M	HIV	<p>HIV infection:</p> <ul style="list-style-type: none"> <li>- Diagnosed in 2012</li> <li>- Initial presentation diarrhoea</li> <li>- First started on Truvada, atazanavir/ritonavir, but was changed to Kivexa, atazanavir/ritonavir due to renal dysfunction</li> <li>- discontinued all treatment &gt; 1 year ago</li> <li>- No resistance mutations</li> </ul>

				<p>Pneumocystis jiroveci pneumonia (PJP):</p> <ul style="list-style-type: none"> <li>- diagnosed March [REDACTED]</li> <li>- CD4: 70 (8%), viral load 197,631</li> </ul> <p>Decreased renal function</p> <ul style="list-style-type: none"> <li>- On background of advanced HIV infection</li> <li>- Heavy proteinuria, without haematuria</li> <li>- Likely HIVAN</li> </ul> <p>Reflection:</p> <p>HIVAN and HIV immune complex kidney (HIVICK) disease are the predominant forms of renal disease related to HIV. HIVAN is seen almost always in patients with advanced HIV infection. Increased susceptibility to HIVAN among this group of patients is associated with polymorphisms in the apolipoprotein L1 gene. HIVAN typically manifests clinically with heavy proteinuria, without haematuria. Treatment for the underlying renal lesion is ART. Prednisone and antiproteinuric agents (ACE inhibitors, ARBs) may also be used. This patient was commenced on Descovy (TAF/FTC) and Dolutegravir for cART and was started on an ACE inhibitor. TAF has a more favourable renal side effect profile compared to TDF. The patient's renal function has normalised and he has no further proteinuria</p>
49.	[REDACTED]	32 M	HIV	<p>Philippines National, not Medicare eligible. Presented for screening bloods after his male partner, who still lives in the Philippines, has tested positive for HIV. Works on a cruise ship, spending a lot of time out at sea. Will be in the [REDACTED] area until December [REDACTED] after which he returns to the Philippines. No chronic medical conditions. No medication. No allergies. Does not drink alcohol or use recreational drugs.</p> <p>Initial HIV workup showed:</p> <ul style="list-style-type: none"> <li>- Western Blot reactive</li> <li>- TB Quantiferon Gold, negative</li> <li>- CMV IgG reactive</li> <li>- Toxoplasma gondii non-reactive</li> <li>- HIV VL 7,158; CD4 330 (21%)</li> <li>- Hepatitis A and B immune</li> <li>- HLA B57:01 excluded</li> <li>- Fully sensitive virus, with no resistances</li> </ul> <p>Reflection:</p> <p>Medicare ineligibility was a barrier to start treatment. The choice of cART is also influenced by its availability in the Philippines. After careful deliberation I decided to commence him on Genvoya (TAF/FTC/EVG/COBI) which was one of two possible STRs accessible via compassionate access from the pharmaceutical company. Compassionate access was the only way for him to get treated without Medicare benefits. He is</p>

				<p>aware that this combination is not available in the Philippines and that he would need to be changed over to a different cART regimen once back home. His HIV remains well controlled and he will return for follow up before leaving for the Philippines.</p>
50.	[REDACTED]	20 M	HIV	<p>HIV infection.</p> <ul style="list-style-type: none"> <li>- Diagnosed May [REDACTED]</li> <li>- Lives remotely in [REDACTED]</li> </ul> <p>We' ve been working with his GP to start him on treatment in May. Was commenced on Genvoya and has a fully susceptible virus. His HIV viral load, however remains at high levels (most recent VL 49800), suggesting that he' s not taking his medication. Of particular concern is that he was also diagnosed with syphilis in June, suggesting that he' s probably having unprotected sexual intercourse with a detectable viral load.</p> <p>Management:  This case highlights significant difficulties in managing HIV-infection in a remote and often transient population. This young man has no fixed address and is very difficult to engage in health services. The houses that he does live in at times are overcrowded and privacy is a major burden to treatment compliance. He is unable to take his medications home with him due to family and friend going through his things all the time and also has no privacy in taking his tablets. He is managed in a multidisciplinary setting by our clinic, his GP, a contact tracing officer and CNC, as well as a peer support group called [REDACTED]. He has been given a mobile phone to assist in communication with health services, but does not answer phone calls due to privacy concerns. His syphilis diagnosis is of great concern regarding him transmitting the virus to sexual partners and he has been referred to the Public Health Unit for assistance and escalation of his risky behaviour.</p>
