

by the end of this session you will know how to use this picture to help you rapidly critique clinical studies (& to teach others how to use it)

Evidence-based medicine is the
(explicit) application of clinical
epidemiological evidence in clinical
decision making

what makes a good teacher?

1. enthusiastic, energetic, excited, passionate & accessible, prepared
2. **highly knowledgeable in their area?**
3. maintains that knowledge base
4. life long reflective learner
5. changes and influences practice
6. **makes their area of expertise accessible**

Contributions SF to NZ diet

Dear sir

I have just read what you said in the sunday paper

From this I can only conclude that you are some sort of
fuckwit

How dare you describe good food like butter as
poisonous

How long have you been in this country?

I bet you are one of the auckland wankers that drive
around with thier lights on

presentation outline

GATE is a framework for:

1. study design
2. study analysis
3. study error
4. practicing EBM

1

GATE: a framework for study design

1 picture

every epidemiological study can be hung on the GATE frame

1 picture, 2 formulas & 3 acronyms

1 picture: GATE frame

cohort of British doctors

smoking status allocated by measurement (observation)

smokers

non-smokers

lung cancer
events counted

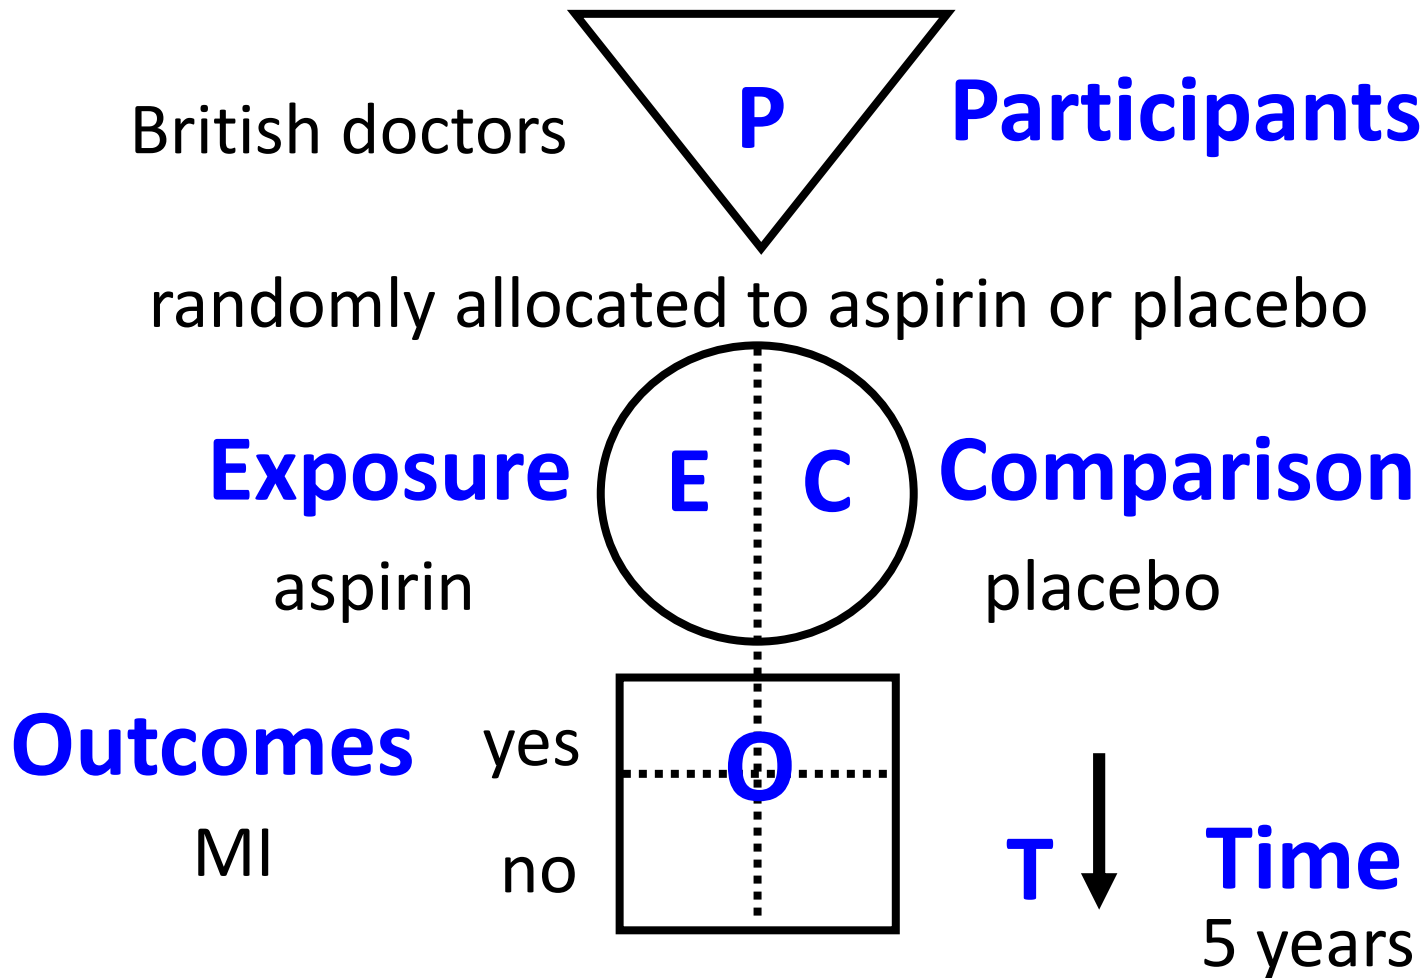

yes
no

↓ followed for 10
years

cohort / ↓ longitudinal / follow-up study

1st acronym: PECOT

randomised controlled trial

cross-sectional (prevalence) study

middle-aged American women

receive mammogram screening test

mammogram positive

mammogram negative

breast cancer

yes

no

diagnostic test (prediction) study

middle-aged American women

Gold Standard

breast cancer

no breast cancer

mammogram test

positive
negative

diagnostic (test accuracy) study

case-control study

(all nested in virtual cohort studies)

\$ 10,000

2

GATE: a framework for study analysis:

1st formula: occurrence = outcomes ÷ population

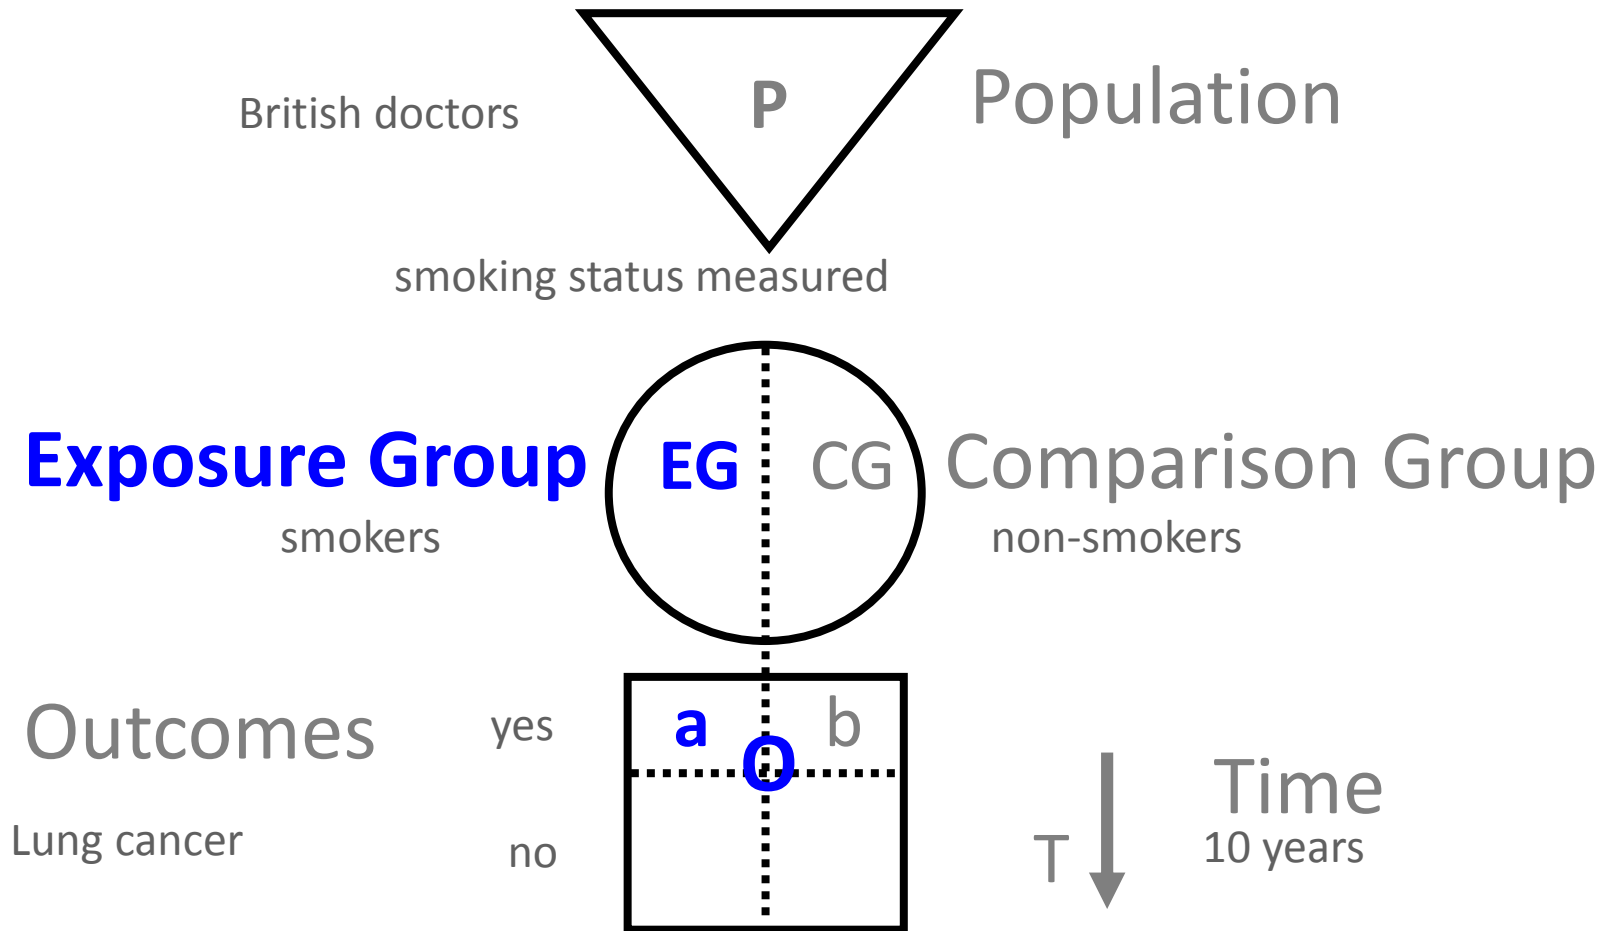

the numbers in epidemiological studies can be hung on the GATE frame

1 picture, 2 formulas & 3 acronyms

1st formula: occurrence of outcomes =

number of outcomes ÷ number in population/group

Exposure Group Occurrence (EGO) = $a \div EG$
 = number of outcomes (a) \div number in exposed population (EG)

Comparison Group Occurrence (CGO) = $b \div CG$
= number of outcomes (b) \div number in comparison population (CG)

Epidemiology = Numerator ÷ Denominator

*the goal of all epidemiological studies is to calculate **EGO** and **CGO***

Middle-aged Americans

Body Mass Index (BMI) measured

High BMI

Low BMI

high

low

EGO:
Average blood
glucose in EG

CGO:
Average blood
glucose in CG

cross-sectional study with numerical measures

Middle-aged American women

Gold Standard

Breast cancer

no Breast cancer

mammogram

positive

negative

EGO:

**likelihood of a positive
mammogram if breast
cancer**

CGO:

**likelihood of a positive
mammogram if no
breast cancer**

1st formula:

occurrence = outcomes ÷ population

its all about EGO and CGO

- $EGO \div CGO = \text{Relative Risk (RR)}$
- $EGO - CGO = \text{Risk Difference (RD)}$

measures of occurrence: risk; rate; likelihood; probability;
average; incidence; prevalence

3

GATE: framework for nonrandom error

2nd acronym: RAMBOMAN

Measurements

ANalyses

1 picture, 2 formulas & 3 acronyms

RAMBOMAN

Recruitment of participants
‘who are the findings applicable to?’

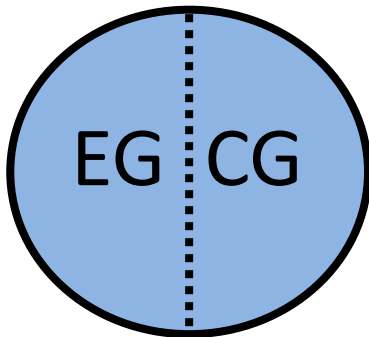

RAMBOMAN: 'how were participants *Allocated* to exposure & comparison groups?'

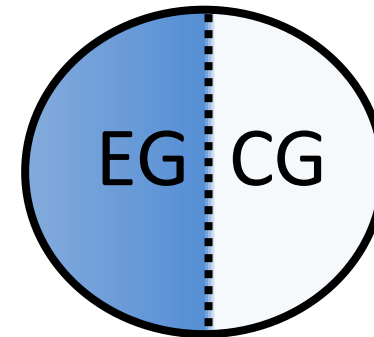

RCT: allocated by **randomisation**
(e.g to drugs)

Cohort: allocated **by measurement** (e.g. smoking)

If randomised,
were EG & CG
similar at
baseline?

RAMBOMAN

*'were Participants well **Maintained** in the groups they were allocated to?'*

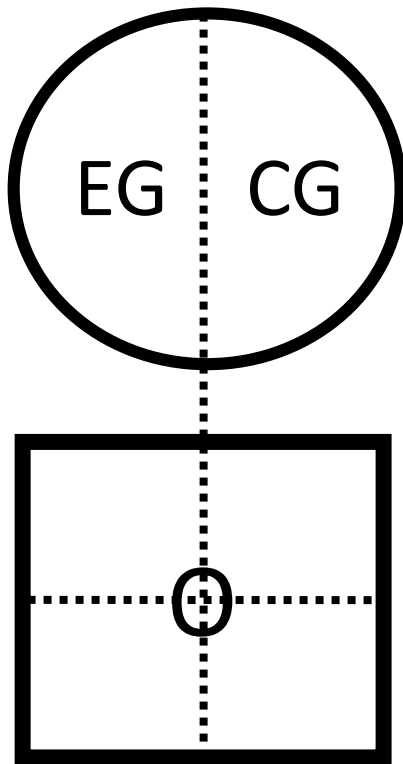

completeness of follow-up
compliance
contamination
co-interventions

RAMBOMAN

*'were exposures & outcomes well **Measured?**'*

were outcomes measured **Blind** to whether participant was in EG or CG (or vice versa)?

RAMBOMAN

*'were exposures & outcomes well **Measured?**'*
were they measured **Objectively?**

RAMBOMAN

*'were the **ANalyses** done well?'*

If RCT were **Intention To Treat (ITT)** analyses done?

RAMBOMAN

*'were the **ANalyses** done well?'*

**adjustment for baseline differences /
confounding?**

GATE: random error: **2nd formula:**
random error = 95% confidence interval

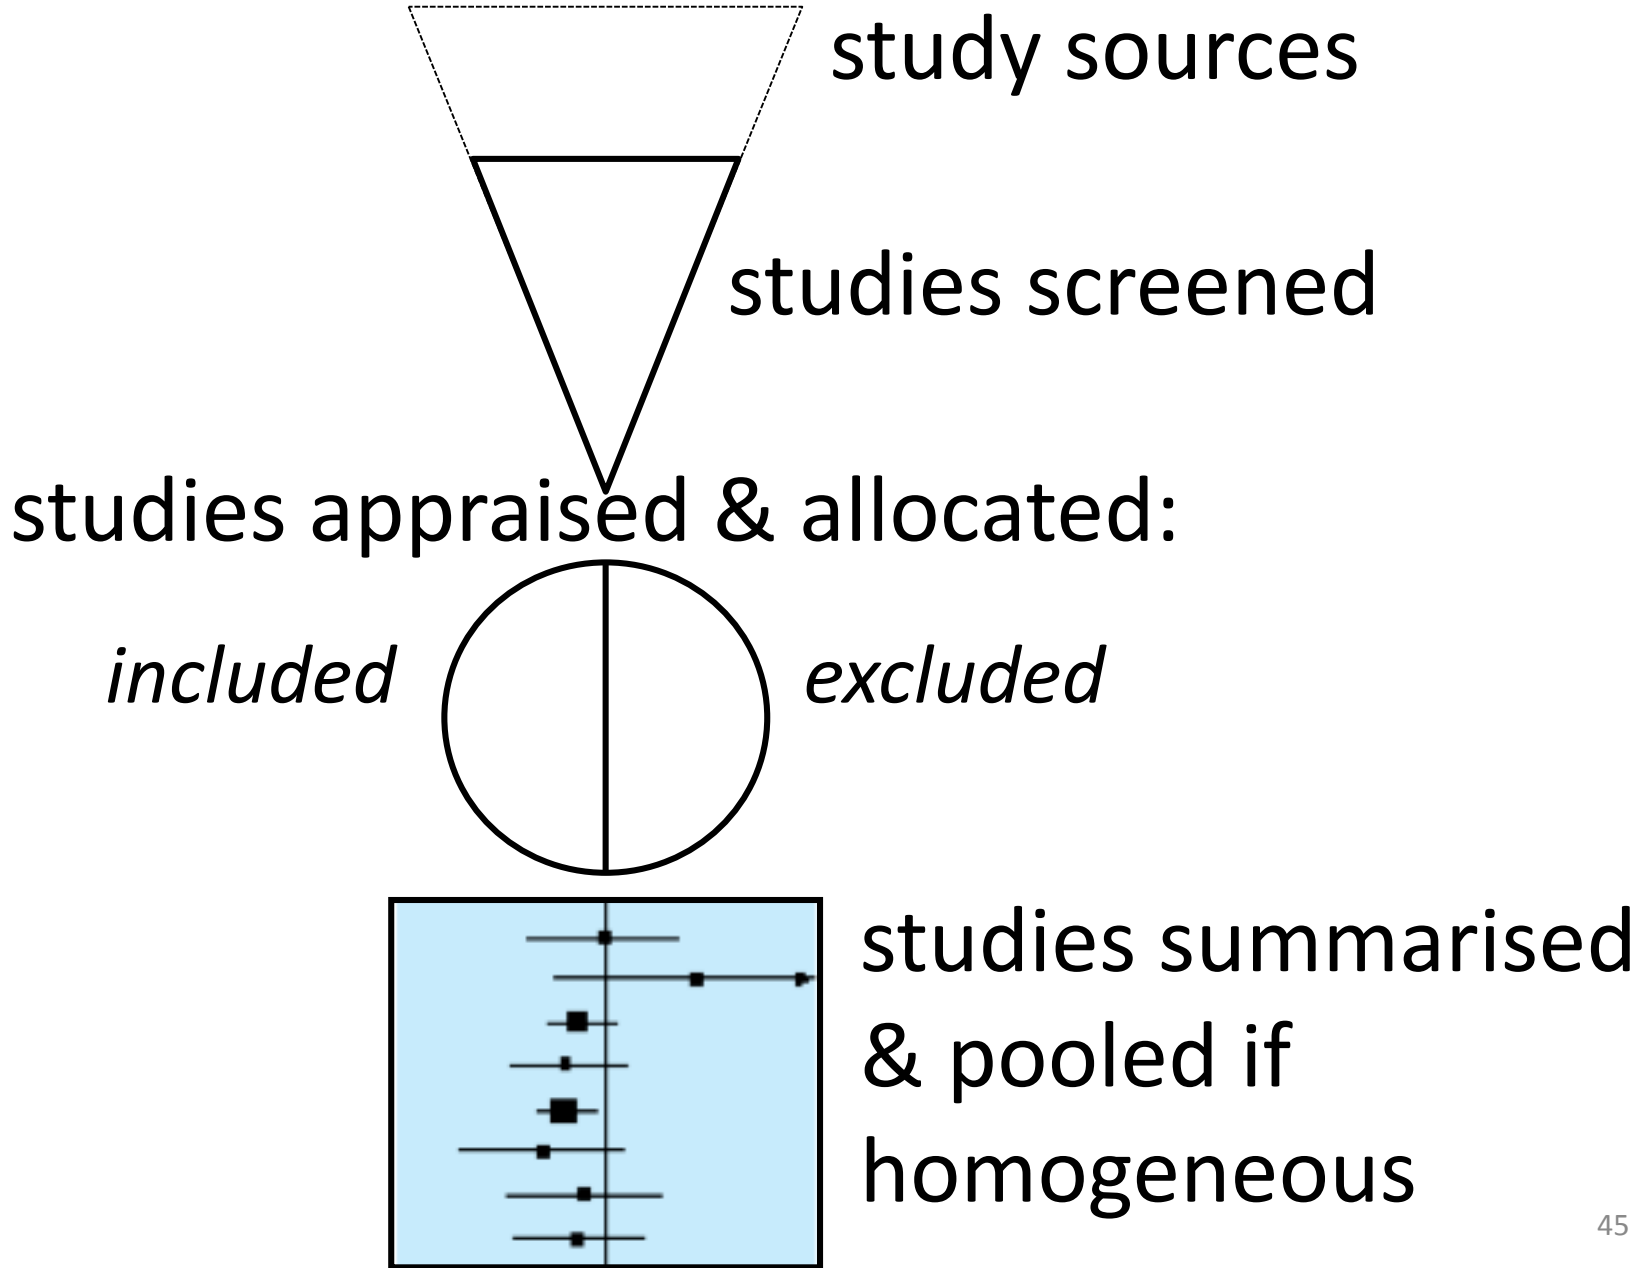

There is about a 95% chance that the true value in the underlying population lies within the 95% CI (assuming no non-random error)

GATE: a framework for error in
systematic reviews & meta-analyses:

3rd acronym: FAITH

systematic review: a study of studies

critical appraisal of SR: **FAITH**

Find

study sources

Appraise

studies screened

studies appraised & allocated:

Include

included

excluded

Total

Heterogeneity?

studies summarised
& pooled if
homogeneous

4

GATE: framework for the 4 steps of EBP

the steps of Evidence Based Practice (EBP):

- 1. Ask**
- 2. Acquire**
- 3. Appraise**
- 4. Apply & Act**
- 5. Audit**

EBP Step 1: **ASK** - turn your question into a focused 5-part PECOT question

2: **ACQUIRE** the evidence – use **PECOT** to help choose search terms

Participants

Exposure

Comparison

Outcomes

Time

3: APPRAISE the evidence – with the picture, acronyms & formulas

Occurrence = outcomes ÷ population

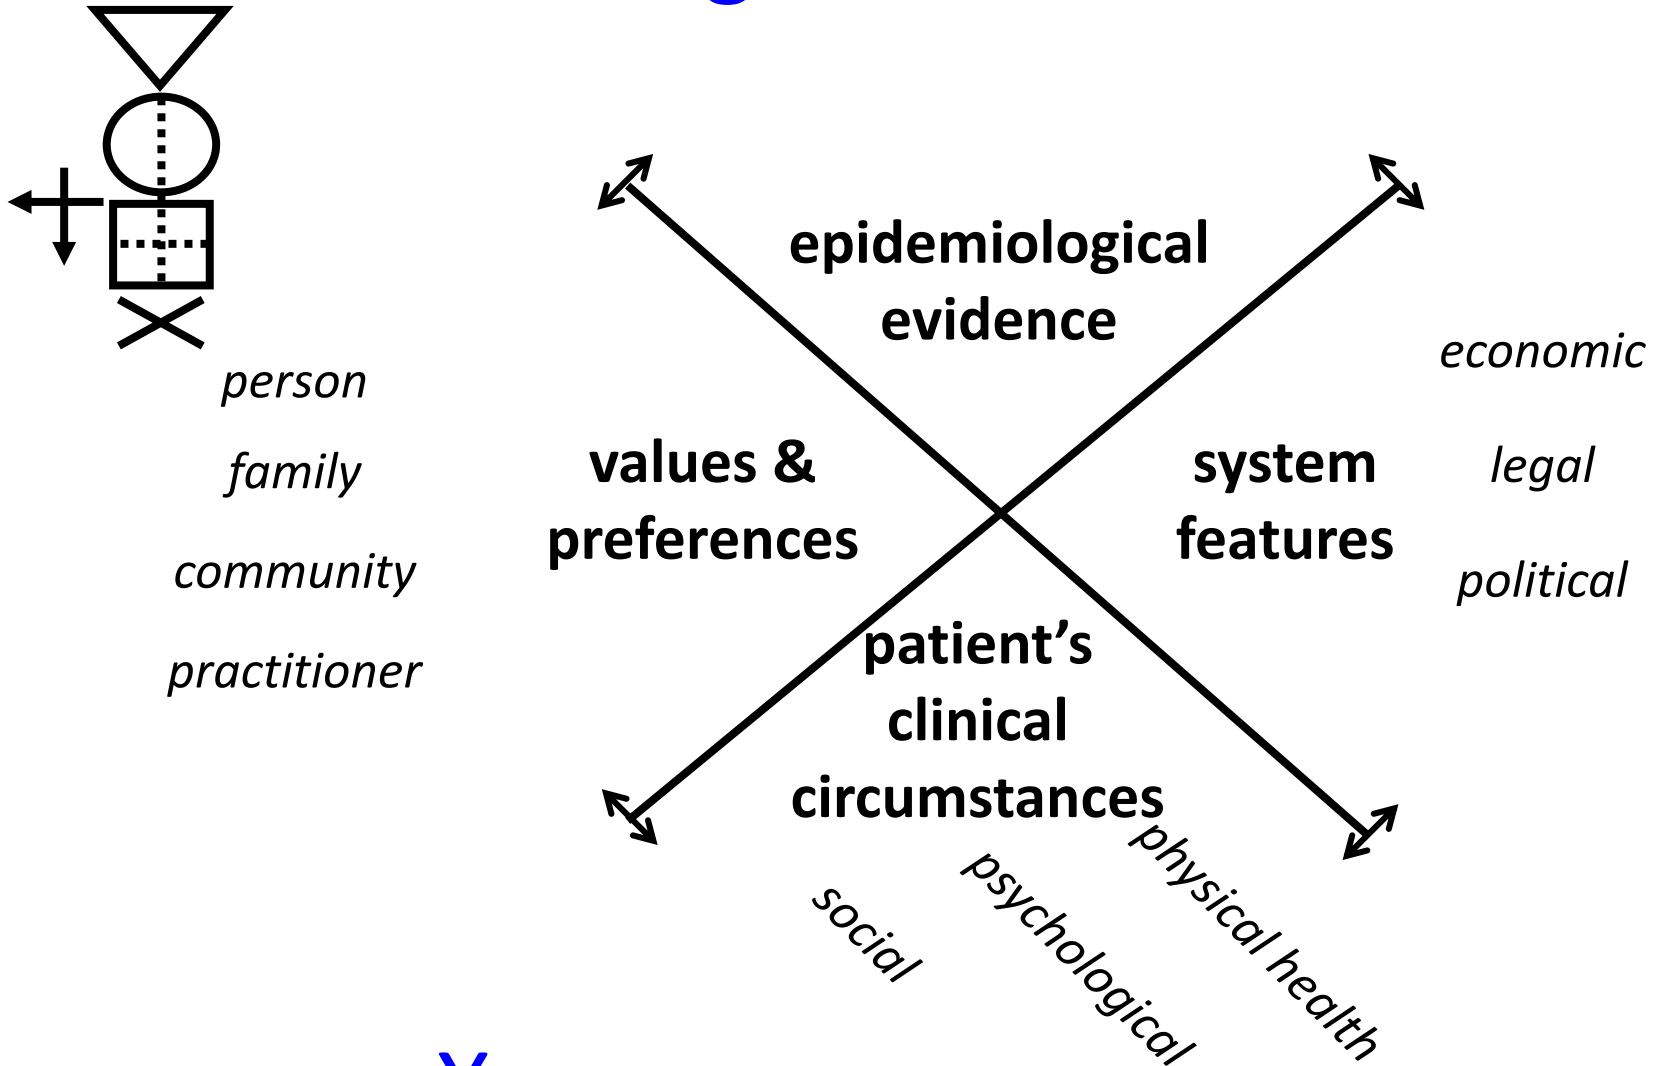

Random error = 95% Confidence Interval

4. **APPLY** the evidence by **AMALGAMATING** the relevant information & making an evidence-based decision: **the X-factor**

X-factor: making evidence-based decisions

Practitioner eXpertise: 'putting it all together' - the art of practice

EBP Step 5: Audit

audit practice against evidence-based standards
and improve quality of practice

GATE critically appraised topic (CATs) excel workbooks:

1. Intervention & risk studies
2. Diagnostic test accuracy studies
3. Prognostic studies
4. Case-control studies
5. Systematic Reviews

www.epiq.co.nz

GATE CAT – 4-sheet workbook (in Excel)

sheet 1: GATE-Ask & Acquire

GATE Ask & Access - for all study types						
Notes for use: Enter text in yellow areas, replacing current text. Help notes appear in movable boxes						
Assessed by:					Date:	
Problem						
Describe the problem that led you to seek an answer from the literature						
Step 1: Ask a focused 5-part question using PECOT framework (EITHER 'your question' OR 'the study's question') note: question doesn't need to be grammatically correct sentence; main aim is to identify key terms for search (Step 2)						
Population / patient / client	Specify the relevant patient/client/population group (be reasonably specific about: medical condition, age group, sex, etc.)					
Exposure (intervention/ target disorder/risk or prognostic factor)	Specify: the intervention(s) you want to find out about for RCTs & other intervention studies; OR the Target disease/condition to be diagnosed for diagnostic test accuracy studies ; OR the risk/intervention factor for case-control studies ; OR the risk/prognostic factor for cohort studies . Be reasonably specific					
Comparison (Control)	Specify the alternative intervention (e.g. nothing or usual care); the typical health status of those without the target disease/condition (e.g. disease free or other comorbidities) for diagnostic test accuracy studies ; the comparison factor you want to compare it with for case-control studies and cohort studies ? Be reasonably specific					
Outcomes	Specify: the relevant health/disease-related outcomes you would like to prevent/reduce for RCTs ; the relevant test for diagnostic test accuracy studies ; the relevant health/disease related outcome/s for case-control studies and cohort studies					
Time	if appropriate, specify a relevant time period over which outcomes likely to occur					
Step 2: Access (Search) for the best evidence using the PECOT framework						
PECOT item	Primary Search term		Synonym 1		Synonym 2	
Population / Participants / patients / clients	Enter key search terms Use MESH terms (from PubMed) if available, then text words.	OR	Include relevant synonym	OR	Include relevant synonym	AND
Exposure (Interventions)	As above	OR	As above	OR	As above	AND
Comparison (Control)	As above	OR	As above	OR	As above	AND
Outcomes	As above	OR	As above	OR	As above	AND
Time	Entry generally not required for search					
Limits & Filters:						
PubMed has Limits (e.g. age, English language, years) & PubMed Clinical Queries has Filters (e.g. study type) to help focus your search. List if used.						
Databases searched:						
List data bases searched						
Evidence Selected						
Enter full citation of publication you have selected/or been given to evaluate						
Justification for selection						
State main objectives of the study.						
Explain why you chose this publication for evaluation.						
Please contribute your comments and suggestions on this form to: t.jackson@euc.ox.ac.uk						

GATE CAT – 3-sheet workbook (in Excel)

sheet 2: GATE-Appraise (with calculator)

GATE Appraise - Intervention Studies RCT/Cohort & Risk/Cross-sectional Studies					
Notes for use: Enter study numbers in yellow areas. Help notes appear in movable boxes. Enter study descriptions in orange areas. The form calculates results and displays them in the green areas. Use the overflow tab to provide more detail if allocated space is insufficient.					
Assessed by:		Assessed when:		Publication details:	
STUDY DESIGN (PECOT)		STUDY NUMBERS - hang on GATE frame		STUDY ERRORS (RAMBOMAN)	
Population	Study type:	Study Setting		Recruitment: able to define who findings applicable to?	
	Describe Setting:	Eligible population		Setting & eligible population appropriate?	
	Describe Eligibility:	Participant population		Participants similar to all Eligibles?	
	Describe Recruitment:			Risk/prognostic profiles sufficiently described to determine who findings applicable to?	
Exposure & Comparison	% eligibles participated:				
	Describe Exposure / Intervention	(EG) EG allocated	(CG) CG allocated	Allocation to EG & CG	allocated randomly or by done well?
	Describe Comparison / Control			if randomised, done well? concealed? EG & CG similar at baseline?	if allocated by measurement: done well? done before outcomes? differences between EG & CG documented?
Outcomes & Time	Describe Outcomes & Time:			Maintenance in allocated groups & on allocated interventions/exposures during study sufficient?	Completeness of follow-up high & similar in EG & CG?
			Compliance high enough?		Contamination low enough?
			Co-interventions similar enough in EG & CG?		Participants/Investigators blind to EG/CG status?
			Blind & Objective Outcome measures?		Outcomes measured accurately enough?
		Follow-up time similar in EG & CG and sufficient to be meaningful?			
Report results per (e.g. per 100): .../1000 persons					
Calculated Results (unadjusted) as % confidence intervals					
Classified in GATE type	Outcome:	Occurrence per 1000 persons	Relative effect (EG/CG)	Absolute effect (EG/CG)	Number needed to treat (NNT) to prevent/cure 1 event
		In exposure group (EG)	In comparison group (CG)		
	Categorical outcome				
	Numerical outcome				
Reported Results					
Analysis					
intention to treat if RCT?		Adjusted if EG & CG different?		95% CIs or p-values given?	
Summary					
1. Study design (AMBOM): non-random error/bias sufficiently low for study to be valid? - consider amount & direction of bias.					
2. Study analyses (AN): analytical error sufficiently low for results to be valid? - were ITT analyses done? were adjusted analyses done if EG & CG different at baseline?					
3. Study numbers: random error sufficiently low (95% CI narrow) for results to be meaningful? if no statistically significant effects, was study power/sample size sufficiently high?					
4. Study effect size: RD +/- or RR sufficiently large to be real and meaningful?					
5. Applicability (R): if 1-4 ok, are findings likely to be applicable in practice?					

GATE CAT – 3-sheet workbook (in Excel)

sheet 3: GATE-Apply

GATE Apply - for all study types	
Notes for use: Enter text in yellow areas	
Assessed by:	Date:
Step 4: Apply. Consider/weigh up all factors & make (shared) decision(s) to act	
<p>The X-Factor</p>	
<p>Epidemiological evidence: are the results of this study consistent with other epidemiological evidence relevant to the decision(s) (e.g. ideally from systematic reviews)?</p>	<p>What Case circumstances (e.g. disease process/ co-morbidities /social situation) specifically related to the problem may impact on the decision(s)?</p>
<p>System features: are there any system constraints or enablers that may impact on the decision(s)?</p>	<p>What Values & Preferences may need to be considered in making the decision(s)?</p>
<p>Decision(s): taking into account all the factors above what is the best decision(s) for this problem?</p>	
Step 5: What are the implications of this decision(s) for practice?	
<p>What are the wider considerations of this decision(s) for usual practice? Should it change usual practice in any way?</p>	
<p>Please contribute your comments and suggestions on this form to: t.jackson@stard.ac.nz</p>	

by the end of this
lecture you will
know how to use
this picture to help
you rapidly critique
clinical studies (& to
teach others how to
use it)

Small white card with text, possibly a name tag or menu item, partially visible at the bottom left.
